Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose
A+	Polymer Applns.	G	Printing, Coating, Photographic Chemistry
AE	Polymer & General Chemistry	H	Petroleum
B	Pharmaceuticals	J	Chemical Engineering
C	Agricultural Chemistry	K	Nucleonics, Explosives, Protection
D	Food, Disinfectants, Detergents	L	Refractories, Ceramics

D1: FOOD; FERMENTATION

D11: BAKING

WINK- D11 74294Y/42 =GB 1555-195
Automatic bakery machine giving crack-free prods. - having kneading plate which moves in circular motion above conveyor belt to produce uniform consistency

WINKLER FR KG 03.04.76-DT-614463
(07.11.79) *DT2614-463 +A23p-01

Automatic portioning, kneading and flat-pressing of dough or meat products by dividing the material into individual portions of predetermined size and transferring them to a continuous rotatable endless kneading belt. A flat rotating kneading plate positioned above the belt produces a rotary action which forms the material into a spherical shape in a manner which eliminates the formation of kneading joints.

Pref. the kneading plate is faced with synthetic polymeric foam e.g. PVC.

By eliminating the "kneaded end" effect, products having a uniform skin are produced. This is esp. desirable in the formation of dumpling-like products since entry of water and steam into the dough body is prevented. 31.3.77 as 013673 (5pp397).

KAOS * D11 81860B/45 ★J7 9032-059
Harusame prodn. from extruded cords of starch compsn. - in which the water used to cool the boiled starch cords contains an additive to prevent sticking of the cords

KAO SOAP KK 06.03.75-JA-027545
(11.10.79) A231-01/16

In a process for producing harusame (a starch-based good in the form of dry sticks), which involves mixing a starch compsn. extruding the compsn. into cords, boiling, cooling, freezing, thawing and drying, the improvement comprises adding to 100 pbw. of the cooling water 0.1-1 pbw. of a compsn. consisting of 5-20wt.% fatty acid ester of propylene glycol or glycerine, 10-35wt.% propylene glycol, 10-35wt.% sorbitol and 30-70wt.% water.

The compsn. prevents sticking of the starch cords.
6.3.75 as 027545. A231 1/16 (11.10.79) KAO SOAP KK (4pp83) (J51125769)

D12: MEAT; FISH PROCESSING

BODE/ * D12 80892B/45 ★CA 1064-850
Meat carcass carrier for overhead l/beam rail - with rectangular frame of round metal stock having top rollers and hook on underside

BODELL F W 27.06.75-CA-230393
Q21 (23.10.79) B61b-12/02

A carrier is of round metal stock forming the bottom and two sides of a rectangle withinward projections from the arms tops fitting in cylindrical rollers of e.g. nylon each longer than its associated projection. The inner surfaces of projections and sides are flattened and meet at a 90° angle, with the roller outer faces also being flat and flush with the sides.

A hook is fixed to the underside of the carrier bottom by a horizontal piece integral with a vertical section and a lower curved section ending in a straight sideways inclined lip. The inside surfaces of the hook horizontal and vertical sections are flattened and meet at 90°.

There is less likelihood of the carcass falling or of metal shavings dropping on the meat than prior art carriers. 27.6.75 as 230393 (11pp1358)

TAMM/ D12 47231Y/27 =DS 2558-726
Ripening and refrigerating layout for abattoirs - speeds up tenderising, ensuring uniform treatment, and reduces operating and labour costs

TAMM W 24.12.75-DT-558726
(31.10.79) *DT2558-726 A22c-18 A23b-04/06

A plant to cool animal carcasses is preceded by a chamber in which the meat is cured by circulating air of controlled moisture and temperature and is sterilized by ultraviolet radiators. The chamber is subdivided into many narrow tunnels which can be operated independent of each other. The tunnels are grouped to a block and can each accommodate a small proportion of the daily throughput. Each tunnel is separated by an insulated, automatically closed partition into a compartment with the UV radiator and the heating element, and another with the air cooler.

This speeds up the throughput of carcasses but does not result in tougher meat through lack of curing. 24.12.75 as 558726 (4pp39)

SCHI- * D12 80932B/45 ★DT 2816-744
Bacon rind peeling machine - with auxiliary slitting blades for processing long-storage bacon

MAJA-MASCH SCHILL H 18.04.78-DT-816744
(31.10.79) A22c-17/12

A machine to remove the rind from sides of bacon has a peeling blade downstream of the gap between a tension roll and a multi-ring back-up roll. An auxiliary device carries several slitting blades which enter between the rings of the back-up roll and produce slits in the bacon.

This enables the machine to process not only fresh bacon but also sides which have been stored for some time and have therefore acquired a round shape. The bacon material is thus easily flattened without excessive pressure.
18.4.78 as 816744 (15pp39)

HART/ * D12 81056B/45 ★DT 2844-003
Deep frozen food block slicing - by pressing sliced plates edgewise across grating of blades

HARTMANN K 22.03.78-FR-008289
P62 (31.10.79) A22c-25/18 B26d-03/18

The Parent Patent described the division of blocks of deep frozen food into single portions, e.g. fish fillets into fish fingers, by applying a pressure of >100 bar across a single row grating of blades to produce plates and by pressing the plates into separate chambers. The second stage has been replaced by applying a pressure to the plates in their longitudinal direction across another grating of blades.

This provides a further development of the sub-dividing process. 9.10.78 as 844003 Add. to 2715535 (13pp39)

MOBA- D12 54167Y/31 =GB 1555-414
Mould for arranging poultry - with one stationary and two swinging walls and a device ensuring enclosure of the wings

APPARATENBOUW MOBA 07.04.76-NL-003625
Q32 + Q31 (07.11.79) *BE-853-071 +B65b-39/02

Poultry modelling machine having a first shell to which two further shells are pivotally linked. The hinged shells with their free edges combine to form a tube structure into which the carcass is introduced. The hinged sections can then be moved into a closed position to urge the poul-

try into the required shape.

The design prevents wings from becoming jammed in the shell members causing damage to the carcass and/or the machine. 7.4.77 as 014786 (15pp397).

TAKE ★ D12 81726B/45 ★ J5 4126-758
Quality improving method for frozen ground fish meat - consists of propylene glycol fatty acid ester with sugar and/or protein material
TAKEDA CHEMICAL IND KK 23.03.78-JA-033912
E17 (02.10.79) A23I-01/32

Propylene-glycol fatty acid ester (a) 0.05-1 w/w% is combined with (b) sugar and/or protein material in ground fish meat when preparing frozen ground fish meat or pasty fish food. The quality-improving agent consists of the compsn. above where the weight proportion of (a) : (b) is 1 : 2-50.

Whiteness and elasticity of frozen ground fish meat and pasty fish food can be improved remarkably. Further the frozen ground fish meat combined with the quality-improving agent has good texture and suffers less from denaturation of proteins in meat during the preservation.

The propylene glycol fatty acid ester has a (un)saturated fatty acid group. The quality-improving effect is due to its emulsifying activity, and it can have a high monoester content. As sugar glucose, fructose, sucrose, lactose, sorbit, wheat starch, corn starch, soy bean polysaccharide, etc. can be used. As protein material soy bean protein, wheat protein, milk protein, etc. can be used. The propylene glycol fatty acid ester is liquid, paste, powder, solid or wax at normal temps. and the quality-improving agent is prepared by mixing the components and making the mixt. into powder or granules depending on the kind of fatty acid ester. 23.3.78 as 033912 (6pp5)

ASAM- D12 26436A/14 = J7 9032-058
Preservation and improving quality of food and drink - by adding melanoidin and fatty acid ester of glycerol e.g. glycerol mono:caprylate or mono:laurate

ASAMA KASEI KK 10.08.76-JA-095783

(11.10.79) *J53020-443 A23I-03/34 + A23b-04/14 A23b-07/14

The quality and keeping properties of food and drink are improved by adding melanoidin and an ester of glycerol and fatty acid.

Melanoidin shows synergistic bactericidal action when mixed with a glycerol-fatty acid ester such as glycerol monocaprylate and glycerol monolaurate. The melanoidin is added at 500-5000 ppm. and glycerol-fatty acid ester at 50-1000 ppm. during or after prodn. of food or drink prod. (e.g., sausages). 10.8.76 as 095783. A23I 3/34; A23b 4/14, 7/14 (11.10.79) ASAMA KASEI KK (8pp) (J53020443)

MOMD ★ D12 81979B/45 ★ SU -648-193
Prodn. of meat-bone flour and technical fat - by compressing comminuted fish or meat industry waste material while passing electric current through it

MOSCOW MEAT DAIRY INST 30.09.77-SU-540997

(D13) (28.02.79) A23k-01/10

Meat-bone flour and technical fat are obtd. by comminuting bones and a soft raw material; heating; sepg. the fat; comminuting the scum; classifying the resulting flour and packing.

The process is intensified and the quality of the product is improved by pressing the comminuted mass ($0.5-500 \times 10^5$) while passing through it electric current (frequency 8-16 KHz; potential 100-400 V, strength 0.5-100 A).

This method can be applied to the processing of slaughter-house offals, fish wastes and other food industry waste
Rogov, I.A., Volchkov, V.I., Pankratov, G.S. Bul. 7/25.2.79. 30.9.77. as 540997 (3pp70)

VLRO= ★ D12 82248B/45 ★ SU -649-389
Sawing appts. for front legs of sheep and goats - has superposed chain conveyors feeding circular saw, and adjustable height lift platform

VOLG ROSMYASOMOLREM 21.06.76-SU-376323
(28.02.79) A22b-05

Appts. claimed in Parent Certificate No. 189710 included a circular saw, and two chain conveyors mounted one above the other for locating and feeding the legs to the saw. The upper conveyor has projections and the lower is mounted on an arm which is pivotable about an axis co-

incident with that of its drive pinion and which is spring-loaded.

In order to ensure reliable operation when handling animals of different weight categories, there is a lifting platform secured by levers to a stand and with a screw pair for adjusting its height position, also a unit for tensioning the conveyors, with hubs for the spindles of the conveyor tensioning pinions. The arrangement permits full mechanisation of the process.

Starkov, V.N., Mineeva, G.F. Bul. 8/28.2.79. 21.6.76. as 376323 Add to 189710 (3pp1358)

MIME= ★ D12 82249B/45 ★ SU -649-390
Appts. for cleaning legs and head of a pig carcass - with height adjustable brushes on slide blocks, either side of overhead conveyor

MINSK MEAT DAIRY IN 27.12.76-SU-435035

(28.02.79) A22b-05/08

The installation comprises an overhead conveyor with pivotable brackets carrying upper brushes for the rear legs and lower brushes for the fore legs and heads, the brushes being adjustable vertically. To permit more thorough cleaning, the brackets have slide blocks for the brushes, and the brush height is adjusted by a lifting mechanism with flexible members connected via pulleys with the slide blocks for horizontal movement. The brushes are linked with the carcass by stays, secured to the brushes below the points at which they are secured to the carcasses.

Litovko, V.I., Dyagilev, N.I., Gabelev, V.M. et al. Bul. 8/28.2.79. 27.12.76. as 435035 (4pp1358)

KIME= ★ D12 82250B/45 ★ SU -649-391
Appts. for filling sausage casings - has carriage mounting vessels with lubricating liquid for extender on which carriage moves

KIEV MEAT COMBINE 07.07.77-SU-504675

(28.02.79) A22c-11/08

The appts. comprises a loading hopper with a driven screw feeder. A carriage is mounted on an extender encompassing the feeder and mounts vessel for liquid for lubricating the outer surface of the extender and for collecting the used liquid. A nut is located at the end of the feeder to prevent the screw being displaced.

Golovan, A.I., Goncharov, P.G., Permyakov, V.I. Bul. 8/28.2.79. 7.7.77. as 504675 (2pp1358)

POLA= ★ D12 82251B/45 ★ SU -649-392
Fish processing machine carrier cassette - with adjustable gap between tail stop plates, to hold fish tail end

POLAR SEA FISH OCEA 28.12.76-SU-437067

(28.02.79) A22c-25/08

A cassette for transporting fish in processing machines comprises end walls connected by guides, head and tail stops interconnected by levers for displacement along the guides, and support plates on the tail stop, which define a gap between themselves for passage of the tail part of the fish body.

In order to ensure correct orientation and reliable location of fish over the whole size range, one of the levers carries a cam cooperating with the tail stop and the support plates can be moved to adjust the gap. The head stop can be adjusted in its height and one of the end walls carries a pivotable device for centring the fish. The gap between the plates is pref. varied by wedges on the guides, each plate having a roller cooperating with the wedges.

Glushkov, A.I. Bul. 8/28.2.79. 28.12.76. as 437067 (4pp1358)

MARK/ D12 77267B/43 #US 4172-304
Filleting machine for fish of different sizes - removes bones completely without waste using spreader and tubular knives

MARKOV V F (TEKH=) 02.06.78-DL-205763 (30.05.78-US-910652)

(30.10.79) *DL-136-795 A22c-25/16

Fish filleting appts. comprises guide flaps feeding and orienting the fish, circular knives to cut out a strip of flesh on the belly and located behind the flaps in succession, and two filleting knives of ring form and mounted on carrying rollers one opposite the other with the cutting edges facing fish movement.

Central Patents Index NEWSLETTER

2nd January 1980

1979 No. 24

* 1. 1980 SUBSCRIPTION RENEWALS

Subscribers who have not yet returned their 1980 Order Forms are urgently requested to send these to Derwent without delay by airmail or first class post to ensure uninterrupted receipt of materials.

Where any delay is envisaged resulting from internal processing by purchasing departments etc., it is essential that subscribers indicate their 1980 requirements by telex to Derwent. Our telex number is 267487.

* 2. 1980 SUBSCRIBER MEETINGS

Within the next two weeks registration forms for the 1980 CPI Subscriber Meetings will be sent to all CPI Subscribers. Details are as follows:

TOKYO, 11-12th March 1980

Hotel Okura, 10-4, Toranomom 2-chome Minato-ku, Tokyo 107
(tel.(03)582-0111) - Subscribers will hear directly from NGB.

NEW YORK 9-10th April 1980

The New York Hilton, 1335 Avenue of the Americas, New York NY 10019 (tel.(212)586-7000). Single Room Rates are \$77 and \$84 per night plus state and local taxes.

AMSTERDAM 14-16th April 1980

The Amsterdam Hilton, Apollolaan 138, 1077 BG Amsterdam
(tel.780780). Single Room Rate Dfl 170 (incl.Service and VAT)

Blocks of accommodation rooms are set aside for the New York and Amsterdam meetings and subscribers wishing to stay at these Hotels should indicate their requirements when returning Registration Forms to Derwent.

Papers by Subscribers will again form an important part of the programme and those wishing to present papers are asked to inform Derwent of their intentions as soon as possible.

* 3. SUBSCRIBER COMMITTEE MEETINGS

Subscriber Committee meetings will be held in London from 3rd to 5th March. To ensure full discussion of those areas with the highest priority at present e.g. chemical coding, invitations have been restricted to members of most currently active committees together with selected members only of others.

* 4. MAILING OF MATERIAL FOLLOWING CHRISTMAS HOLIDAY

Following closure of Derwent's offices over the Christmas period with no despatch on Wednesday 26th December, the despatch dated January 2nd will constitute the last of the 1979 subscription year. Subscribers should therefore note that the first consignment of material for the 1980 Subscription year will be dated Wednesday 9th January 1980.

In returning to the normal schedule slight delays in actual despatch date of a day or so will be inevitable for a short period and certain issues of Alerting Bulletins etc. published early in 1980 will contain the documents published in a two-week period by certain countries in a single weekly issue. Two British issues will be included in week C01.

* 5. BELGIAN PATENTS

Due to filming problems at the Belgian Patent Office, no Belgian aperture cards have been received since patents published 3rd December 1979. Therefore there will be no Belgian patents included in week C01.

* 6. PATENTS SUPPLY PRICES

Due to increased costs - in particular an increase in the price charged by the British Patent Office for British specifications - we have been forced to increase the prices of certain patents specifications as indicated in the attached leaflet.

* 7. INSTRUCTION MANUALS

The attached Appendix describes the new arrangements for Instruction Manuals. Subscribers are asked to note that Manuals 1A and 1B will now be amalgamated into one manual called 1A CPI/EPI USER'S MANUAL - GENERAL.

Instruction Manual No. 3 describes the chemical punch codes for CPI Sections B, C and E applicable from 1981. Existing codes are fully described in the current edition of manuals No. 5 - Chemical Punch Code Manual and No. 5A - Chemical Punch Code Instruction Manual, copies of which continue to be available from the Patents Supply Division.

* 8. INSTRUCTION CLASSES

Subscribers will be aware that we have recently held a round of instruction classes in North America and Europe. We now wish to plan itineraries for the next round of classes to be held in the Spring of 1980. Dates and venues will be agreed later, but classes will normally be in-house or at centralised locations as near as possible to subscribers' premises. In addition, subscribers may request in-house custom-made classes according to their specific requirements, and Derwent will send a suitable person according to these requirements. There is no objection to a small group of companies in an area jointly requesting an in-house class to be hosted by one of them.

We are hoping to hold centralised classes in at least one other location in North America other than Washington, and in at least one other location in Europe other than London, though this obviously depends on demand. The number of types of classes available has been reduced in order to reduce the confusion that arose during the planning of the present round of classes. Classes available were described in the questionnaire accompanying previous Newsletters.

Classes will be taken by personnel from our Technical Services Division or, when relevant, from our Coding Division; in all cases, tutors will be experienced in handling customer searches.

The cost of centralised location classes (including luncheon) will be £25 or \$60 per attendee per day other than the online class which will be £35 or \$85 per attendee per day. The in-house custom designed classes will cost £125 or \$300 per day.

In order to enable Derwent to assess demand and fix suitable itineraries, please indicate on the questionnaire your interest in in-house and/or centralised classes and return it to us immediately.

9. ONLINE ACCESS RESTRICTIONS

Changes in online access restrictions announced in Newsletter Number 22 will not now be implemented at least until mid-1980 after full discussion at the 1980 CPI Subscriber Meetings.

APPENDIX

INSTRUCTION MANUALS

Instruction Manuals Nos. 1 and 4, listed below, have been issued in loose leaf form, to be followed by Instruction Manuals Nos. 2 and 3 early in 1980. All CPI/EPI and registered online subscribers have received a free copy of Instruction Manual No. 1. All CPI/EPI subscribers will receive a free copy of Instruction Manual No. 2. All full subscribers to CPI Sections B, C or E will receive a free copy of Instruction Manual No. 3 and Section A subscribers have received a free copy of Instruction Manual No. 4. Binders are being despatched separately.

Further copies of any one manual may be ordered from our Patents Supply Division at a cost of £5.00, \$12.00 or Y3.00.

Each free copy, or each copy ordered, of any manual will give entitlement to receive a binder and replacement pages automatically for at least the next two years.

I. M. No. 1: CPI/EPI GENERAL INSTRUCTION MANUAL

- 1A CPI/EPI User's Manual - General
- 1C Online Instruction Manual
- 1D Magnetic Tape Products

PATENTS COPY SERVICE

The Patents Supply Division has been organised to give an extremely rapid turnaround at low prices. The schedule of prices and turnaround times, together with the methods of ordering and payment, is given below.

SCHEDULE OF PRICES AND TURNROUND TIMES AS FROM JANUARY 1980

COUNTRY	DELAY from receipt of order within:	COST inclusive of (airmail) postage	SURCHARGE if applicable	NOTES
BELGIUM EUROPE PCT	1 day	per page £0.11, \$0.29 or Y84	—	Photocopies
FRANCE	2 weeks	per patent £1.55, \$3.60 or Y950	1p, 2c or 8Y per page if more than 20 pages	Printed copies. Delay reduced to 4 days for double the normal cost.
GREAT BRITAIN	2 days	per patent £1.65, \$3.75 or Y1000	—	Printed copies
JAPAN	4 days	per patent £1.10 or \$2.55	—	Photocopies
NETHERLANDS	1 week	per patent £1.50, \$3.45 or Y860	1p, 2c or 8Y per page if more than 20 pages	Printed copies
SOUTH AFRICA	3 weeks	per page £0.27, \$0.60 or Y170	Minimum charge equivalent to 5 pages	Photocopies
UNITED STATES	4 days	per patent £1.45, \$2.75 or Y880	13p, 25c or 80Y per page if more than 15 pages	Photocopies
WEST GERMANY	2 weeks	per patent £1.70, \$4.00 or Y1,040	1p, 2c or 8Y per page if more than 20 pages	Printed copies. Delay reduced to 4 days for double the normal cost.
CANADA SWITZERLAND EAST GERMANY SOVIET UNION	4 days	per page £0.19, \$0.50 or Y120	Minimum charge equivalent to 5 pages	Photocopies
* Copies of specifications can now be supplied for Austria, Brazil, Denmark, Finland, Hungary, Israel, Italy, Norway, Rumania and Sweden. Prices comprise actual costs plus a nominal handling fee. *				

METHOD OF ORDERING

- (i) By books of standard order forms available upon request, or
- (ii) By letter, or
- (iii) By telex, to cut postal delay. French and West German patents ordered by telex are processed as rush orders at double normal cost (see NOTES above) unless normal service requested.

METHOD OF PAYMENT

- (i) On receipt of bi-monthly invoices, or
- (ii) By charges against deposit accounts. Subscribers are encouraged in their own interest to open deposit accounts with us so as to avoid the need for frequent payments.

Please address orders and enquiries to the Patents Supply Division.

A flattener for flattening out the belly flanks and guiding the fish is interposed between ring and circular knives, and has cylindrical sides in the zone of the cutting edges. The distance between the cylindrical surfaces and cutting edges corresponds to max. rib bone thickness. 30.5.78 as 910652 (5pp1358)

HENE/ ★ D12 82345B/45 ★US 4172-305
Bacon belly hanger for bacon mfr. - has prongs projecting laterally from cross bars with grips facilitating insertion and removal
HENE BRY J P 19.05.78-US-907716
(30.10.79) A22c-17/02

A hanger has spaced prongs projecting in a common plane at right angles to an elongate cross frame formed by a pair of spaced bars depending from a support hook with a grip to be held while the prongs are inserted into the meat.

A further grip extends in the direction opposite to the prongs and can be held while the prongs are removed from a bacon slab. One bar is turned over at the ends for welding to the other bar and its ends are turned out to form the end prongs. Pairs of prongs are pref. formed by U-shaped rods with ends bent out orthogonally of the frame. 19.5.78 as 907716 (5pp1358)

HOPK/ ★ D12 82346B/45 ★US 4172-306
Crab leg opening utensil - rigid flat blade slotted from end for use as lever when slid onto shell
HOPKINS C H 19.04.78-US-897733
(30.10.79) A22c-29/02

A utensil has a flat blade extending from a handle, an open-ended slot extending from the blade free end along its longitudinal axis for part of its length to divide the blade into two symmetrical sections. Blade material and size are such that all parts are rigid and inflexible.

The slot is pref. of constant width, and the slot end nearest the handle communicates with a circular opening of greater diameter than slot width. The combined length of slot and opening is pref. not more than half the blade length beyond the handle. The blade is slid onto the shell and used as a lever. 19.4.78 as 897733 (4pp1358)

BEAF ★ D12 82485B/45 ★US 4172-901
Denaturing comminuted food - by mixing carrier e.g. tallow and dye at elevated temps. and injecting into or onto food
BEATRICE FOODS CO 11.01.78-US-868538
C03 (30.10.79) A22c-13

Denaturing comminuted food which is unfit for human consumption comprises applying a dye to the food in streaks. A carrier which is normally immiscible with the food at room temp., is elevated to a temp such that the carrier is temporarily converted to a liquid state. A water soluble dye which has a colour distinguishable from the food is mixed with the carrier.

The food is directed and maintained in a continuous stream at a temp. no higher than ambient and the dye/carrier mixture is applied to the food to form discrete streaks which are converted to a state immiscible with the food by reduc. of the mixture temp. on contact with the food.

Method is useful for denaturing meat unfit for human consumption but suitable for consumption by animals. 11.1.78 as 868538 (7pp954)

Anthocyanin recovery and fractionation by treating aq. extracts using ultrafiltration and reverse osmosis techniques

SEFCAL SOC ETUD FAB COMM 22.07.75-FR-022854

E23 (07.11.79) *NL7607-896 C09b-61

An anthocyanic extract is treated in a first ultrafiltration stage to separate off a liq. filtrate which passes through an ultrafilter membrane from a first concentrate contg. anthocyanine of high mol. wt.

The liq. filtrate is then subjected to reverse osmosis to obtain a diffusate which passes through a reverse osmosis membrane, yielding a second concentrate contg. a low mol. wt. anthocyanin. Pref. the anthocyanin extract is produced from grape (prods.) dissolved in a water alcohol medium.

The treatment enables both the concn. and purification of anthocyanins, without recourse to excessive heat build up or the use of chemical agents foreign to the prod. 21.7.76 as 030366 (5pp931).

CALI D13 72263A/40 =GB 1555-28
Increasing microbial cellulose fermentation rate - by using a haloalkyl:thio:hydantoin

CHEVRON RESEARCH CO 31.05.77-US-801933

C02 E13 (E16) (07.11.79) *US4101-679 A23k-01 +C12b-01/2 C12d-13/06

A cellulosic material is fermented using a cellulose-digesting microorganism, in the presence of a cpd. of formula (I).

In (I) R_1 and R_2 are each H or 1-6C alkyl; and R_3 is a haloalkyl gp. contg. 1-2C atoms and 1-5 Cl or Br atoms.

Pref. the cellulosic material is a cellulosic animal feed, but may also be paper, municipal waste, wood, cotton, straw, bagasse, rice hulls, etc. Fermentation is pref. effected in vitro. 4.5.78 as 017846 (3pp997).

SWIF D13 76171A/42 =GB 1555-42
Rapid prodn. of ripened flavour cheese - using *Lactobacillus plantarum* and *Streptococcus durans* bacteria and pre-gastric lipase(s)

SWIFT & CO 21.06.76-US-697712

(07.11.79) *US4119-732 A23c-19/02 +C12k-03

Cheese is produced by treating milk with an acid-forming bacteria, coagulating the milk by the addn. of an enzyme, expelling the whey, and curing the resultant curd at $>45^\circ\text{C}$. >1 Selected strain of *Lactobacillus plantarum* and >1 selected strain of *Streptococcus durans* is added to the milk or curd before curing. *L. plantarum* is present in amt. 2-5 times w.r.t. *S. durans*. Pref. pre-gastric lipases obtd. from the throat tissue of kids, calves or lambs are added in soln. with the milk coagulating enzyme before curing.

The process is esp. used for making mature cheese, such as American cheese and other cheeses with similar curds characteristics, texture and flavour. 1.6.77 as 023286 (6pp931).

★ D13 81185B/45 ★GB 2019-813
 n. of beverages in vending machines - by adding a small vol. of
 surised cold water to dissolve powder
WITTENBORG P E 26.04.78-DK-001820
039 (07.11.79) B01f-05/20 B67d-05/37
 erages are prepd. in portions by adding a premeasur-
 mt. of a flavoured powder to a container such as a
 tic cup. The cup is partially filled with water under
 ht overpressure and during this process or immediate-
 afterwards pressure water is added to the cup for eff-
 ve mixing of the liquid. Pref. the pressurised water
 ntroduced in a direction which causes the liq. to cir-
 ate. The pref. pressure of the water is 3-4kp/cm² and
 pressurised water makes up 5-25% of the total amt. of
 er.
 The method is used to make a beverage, such as tea,
 fee or cocoa, to be dispensed from a vending machine.
 e powder is successfully dissolved using the water at
 reased pressure. As this water only forms a fraction
 the total vol. it can be at a lower temp. than the bulk of
 liq. and thus the problems of calcareous deposits pro-
 eed by using very hot pressurised water are obviated.

 eating potatoes to increase preservative properties - by
 phalising with heat and adding poly:phosphate
Q.P. CORP 20.03.78-JA-032036
(02.10.79) A23l-01/21

The method is characterised by heating potato for alpha-
 ising and combining polyphosphate with alphasised potato.
 he alphasised potato can be preserved for 5-7 days with-
 eeping the good quality directly after the alphasising with-
 out formation of nasty odour and discolouration.

Specifically cut or mashed potato is heat-treated in hot
 ater of 75°C for 10-50 mins. or with steam of 100°C for
 10-60 mins. The polyphosphate is e. g. Na polyphosphate,
 polyphosphate, Na metaphosphate, K metaphosphate, Na
 yrophosphate. Polyphosphate is used in amt. of 0.03-2.0
 on potato. 20.3.78 as 032036 (3pp5)

AKA-★ D13 81725B/45 ★J5 4126-751
 konjak compsn. - contains food, such as dried bonito flakes, and
 ot. seasoning such as sugar
TAKAHASHI SEITAI KK 23.03.78-JA-033824
A97 (02.10.79) A23l-01/21
 the konjak compsn. is obtd. by combining konjak with other
 ingredients and opt. seasonings. As the ingredients, food-

(s) selected from wakame seaweed, sea tangle, ginger and
 flakes of dried bonito, can be used and as seasoning, sugar,
 sodium succinate, sodium arginate and/or sodium gluta-
 mate, can be used.

The obtd. konjak is delicious and is preserved and can
 be served not only as the material for Japanese hotchpotch
 and cooked dishes, but also esp. as sashimi konjak.

In the case of bagged konjak, konjak powder, water,
 ingredients and seasonings are mixed at 25°C and the mixt.
 is stood for an hour to form a paste. Then, the paste is
 bagged and the bag is moulded in a frame. The moulded
 bag is immersed in hot water (90°C) for 20 mins. to solid-
 ify and sterilise the konjak. In the case of unbagged kon-
 jak, the materials are treated as above except the bagging
 process. Thus prepd. konjak is delicious and can be pre-
 served for > 3 months at 20°C. 23.3.78 as 033824 (3pp5)

 Conc. cream - contg. sucrose fatty acid ester, glycerine fatty acid
 ester and opt. other cpds. as emulsifiers
NIPPON OILS & FATS KK 17.03.78-JA-029848
E17 (02.10.79) A23l-01/19

The conc. cream is composed mainly of oil and fat, emuls-
 ifier, sugar, fat-free milk solid and water, and is chara-
 cterised by using sucrose fatty acid ester (SE) 0.2-1.5
 w/w%, glycerine fatty acid ester (GE) 0.2-2.5 w/w% and
 opt. other emulsifiers, as the emulsifier ingredients.

Prod. is a stable solid cream and whipped cream hav-
 ing desirable properties and taste and flavour can be pre-
 pd. by whipping it with water, milk or fruit juice. It is
 superior to liq. creams and conventional concn. creams
 in that (1) it is highly stable and can be preserved for a
 long time at room temp.; (2) it shows good whipping prop-
 erty and can be whipped at room temp. to give whipped
 cream of excellent form-holding property; (3) it is free of
 viscosity-increasing agent it has excellent texture and
 taste; (4) it is highly stable to acid and sour whipped cream
 can be prepd. by combining with fruit juice, citric acid,
 etc. and (5) it has excellent freezing resistance and thaw-
 ing resistance and confectioneries prepd. with it can be
 preserved in a refrigerator for a long time.

As SE, that of HLB > 2 can be used and it is used in an
 amt. of 0.2-1.5 (0.4-1.5) w/w% on whole concn. cream.
 As GE, that mainly of monoester of 16-18C fatty acid can
 be used and it is used in an amt. of 0.2-2.5 w/w% on
 whole conc. cream. 17.3.78 as 029848 (8pp5)

 Rice cake prepn. - by combining 3-oxy-2-methyl-(4)-pyrone flavour
 precursor, bread flavour, reducing oligosaccharide and crude rice
 protein in waxy corn starch
NIPPON SHOKUJIN KAK KK (TOYO-) 24.03.78-JA-033653
(02.10.79) A23g-03

The method comprises (a) combining a flavour precursor
 composed of 3-oxy-1-methyl-(4)-pyrone, Saint Jones-type
 bread flavour, reducing oligosaccharide and crude rice
 protein in waxy corn starch (b) preparing mochi (rice
 cake) with the mixture, standing the mochi for cooling,
 cutting it in proper pieces and roasting or frying the piec-
 es.

The sulphite odour and sweetness specific to waxy corn
 starch, can be removed and the rice cakes which are equal
 in taste and flavour to those prepared from glutinous rice
 only, can be prepared in a short time.

Crude rice protein of protein content 45-60% is pref.
 used in an amt. of 0.05 (0.1-1.0) wt. % as protein on the
 dough. Pref. Saint Jones-type bread flavour, 3-oxy-2-
 methyl-(4)-pyrone and reducing oligosaccharide are used
 in amts. of 20-300 pts. wt., 0.5-8 pt. wt. and 0.25-4 pt.
 wt. on 100 pt. wt. of the protein in crude rice protein
 respectively. 24.3.78 as 033653 (8pp5)

 Frozen custard pudding prepn. - from a milk obtd. from soybean
 powder, water carrageenan or pharcelelan, mono-glyceride locust
 bean gum and sodium ascorbate
MACHIDA SHIGYO KK 17.03.78-JA-029817
(02.10.79) A23l-01/18

The method comprises (1) preparing very fine soy bean
 milk from 7-11 pts. refined fine soy bean powder and

93-89 pts. water; (2) adding 0.4-0.7% carrageenan or pharcellelan, 0.1-0.3% monoglyceride, 0.1-0.3% locust bean gum and 0.05-0.1% sodium ascorbate, (3) adjusting its pH to 6 and (4) using the obtd. processed soy bean milk as starting material for the custard pudding instead of cow's milk.

The undesirable taste and flavour specific to soy bean milk can be removed. By adding sugar and whole eggs to the bean milk, heating, adding perfume, filling the mixt. into vessels and freezing, a frozen custard pudding with excellent texture and preservability property, and which does not drip after thawing, can be prepd.

Carrageenan or pharcellelan is used as coagulation stabiliser. The monoglyceride has a HLB of 8-12 and is used together with locust bean gum to improve the water-holding property and texture of the custard pudding. Sodium ascorbate is used as antioxidant, prevents oxidn. of fat and suppresses the increase in viscosity when heating. 17.3.78 as 029817 (2pp5)

Cultivation of fodder yeasts on brewery wastes - subjected to
thermal hydrolysis followed by enzymic hydrolysis to improve
utilisation of solids by yeast cells

BEER NON-ALCOHOL IN 17.06.74-SU-035420

C03 (D16) (28.02.79) A23k-01/06

Brewery wastes are subjected to thermal and fermentative
hydrolysis, and fodder yeasts are cultivated on the hy-
drolysate.

The food prods. utilisation degree is increased by sub-
jecting to the thermal hydrolysis malt and hop particles
mixed with solid brewery wastes (grain and malt cleaning
wastes, grain-soaking liquor, germs, etc.).

The mixt. is ground, mixed with sterilised after-soak-
ing water, and extracted. About 70-80% of the super-
natant liquid is withdrawn by decantation and used for
cultivation of fodder pentosan yeasts. The remaining
liquid is mixed with thermally hydrolysed wastes (as
defined above), and a fermentative hydrolysis is perform-
ed. The resulting hydrolysate is divided into two phases.
The liquid phase is mixed with a protein sediment to form
a nutrient medium for the cultivation of fodder pentosan
yeasts. The solid phase is granulated and used as a fodd-
er.

Protein isolation from defatted soybean flakes - to obtain four fractions with different properties

ANDERSON CLAYTON LTD 30.09.77-GB-040831
(30.10.79) A23j-01/14

Defatted soybean flakes are (a) mixed with water and held at elevated temp. to solubilise protein; (b) insolubles are removed; (c) the liquor is cooled over 1-3 hrs. to 5-10°C, forming curds and whey; (d) the curds ('Fraction C') are separated and (e) preserved, pref. by freeze- or spray drying.

The whey may be further treated to yield more protein fractions by (i) adjusting the pH to 4.5; (ii) separating the curd formed, and (iii) preserving the curd ('Fraction 9-C'). Alternatively, the whey from step (a) is heated to 32-38°C, the pH is adjusted to 5.3 to form a curd ('Fraction M') which is separated and preserved. The second whey soln. thus obtained is then cooled to 10-16°C, the pH is adjusted to 4.5, and the curd formed is separated and preserved ('Fraction W').

The four fractions have useful different physical and functional props. Fraction C resembles Na caseinate in soln. Fractions 9-C and M resemble conventional soybean protein isolate, but are stronger gelling agents. Fraction 9-C has a very light colour and bland taste. Fraction W may form viscous smooth rubbery solns. or custard-like gels. It could be a substitute for albumen. 27.4.78 as 900556 (8pp955)

Water impregnation with carbon di:oxide - using flow generator driven by circulating component flow to impregnation zone under pressure

DAGMA DEUT AUTOMATE 26.04.78-DT-818283

(31.10.79) C02d-01/02

Water is impregnated with CO_2 by introducing CO_2 and water into an impregnation zone held under increased pressure. The CO_2 is passed through the pores of a porous body into an impregnation zone range below the water level. The water is set into a light motion, at least in CO_2 outlet zone into water by means of an activatable flow generator, e.g. a screw, blade or turbine-like wheel. Novelty consists in driving the flow generator with CO_2 and/or water, while making use of the flow stream to the impregnation zone.

The process can be used for the home-prodn. of carbonated water, opt. with the addn. of ice-pieces.

Fine bubble reunion to larger bubbles is prevented. The energy of the fluid supplied under pressure is made use of to drive the flow generator.

The CO_2 gas is pref. passed first through the flow generator activation zone and then to the porous body. In a specific embodiment, where water is sprayed as a mist under pressure in the impregnation zone area above the water level, at least some water is by-passed under pressure through the flow generator activation zone and then

f. sprayed as a mist into the head room of the impregnation zone. The CO₂ gas and/or water are allowed to flow out of the flow generator impeller zones. 26.04.78 as 283 (3pp200)

(31.10.79) C02b-03/08

Before intensely mixing with the water to be treated, the halogen and/or O₂ is/are brought to a zone which is directly near to the source of radiation, and is/are dissociated there by radiation. After flowing through this zone, the halogen and/or O₂ reach zones further away from the source of radiation, where it/they are intensely mixed with the water.

Less halogen is needed to achieve the same high degree of disinfection. Proximity to source of radiation, increases halogen temp. and reinforces dissociation. 27.4.78 as 818412 (19pp200)

Cylindrical liquid filter - with easily exchanged filter insert defining two chambers
SCHMITT G 28.04.78-DT-818699
J01 (31.10.79) B01d-35/02

A filter for water or other liquids consists of a casing which is divided by an exchangeable element into two chambers. This element is either a filter cartridge or a partition into which several tubular filter cartridges have been screwed.

This filter is simple to mfr. and is easily accessible for an exchange of the element. It can be readily modified to suit various filtering problems. 28.4.78 as 818699 (19pp39)

SULZ★ D15 81033B/45 ★DT 2818-729
Fixed bed filter for water purificn. - having filter beds in parallel with overflow weir for clean water and provision for backflushing using clean water
GEBRUDER SULZER AG 26.04.78-CH-004490
J01 (31.10.79) B01d-23/24

Rapid filter plant has filter beds which are cleaned by

backflushing. It consists of several filter beds connected in parallel formed from particulate material on a support in a vessel. Clean water runs off via a common collection system to a weir which creates a back pressure above the bed.

A sludge run off branch is provided on each bed below the liquor level and to purge the bed, the sludge valve is opened and air injected below the bed, the feed being shut off. Clean water flows back through the bed. The number of parallel beds should be ≥ 1 unit greater than the ratio of purge velocity to filtration velocity.

For filtering and preparing water. Provides a simplified scheme of operating the backflushing on such beds. 28.4.78 as 818729 (14pp1053)

Chalk or lime based compsn. for desulphurisation of gas - contains (bi)sulphite ions and graham's salt or poly:phosphate, increasing sedimentation rate

MARTIN MARIETTA CORP 28.04.78-US-901164

E36 J01 L02 Q42 (31.10.79) B01d-53/34 C02c-05/02 C04b-29/02 E02d-03/14

Removal of SO_x from gases by contact with components contg. water, Ca ions, (bi)sulphite ions and opt. sulphate ions at 2-100 (2-60)°C. takes place in the presence of Graham's salt (I) or a dissolved polymer (II) of the formula $\text{M}_x\text{P}_n\text{O}_{(3n+1)}$ (in which M is a y-valent cation, $n > 1$, $x = (n+2)/y$), giving a sludge with improved properties. The wt. ratio of Ca to (I) or the $\text{P}_n\text{O}_{(3n+1)}$ -pt. of (II) is 1:0.0015-0.2 (1:0.001-0.04).

The claims also cover a new material contg. chalk or limestone and (I) or (II), opt. in conjunction with water.

The sludge has a faster initial sedimentation rate than one obtd. without addn. of (I) or (II). It can be used as land-fill, for liming land or as raw material to be oxidised and converted to plasterboard. Since more water than usual can be removed from the sludge, fewer and smaller lagoons are needed, so that land is saved, whilst the cost of the process is relatively low, wince it uses cheap chemicals in small amts.

A suitable compsn. contg. 1 pt. Ca and 0.01 pt. (I) was prepd. by mixing 50 g. CaO with 0.355 g. (I). 26.4.79 as 916975 (23pp16)

Condenser for distn. plant partic. for aromatic plants - has more efficient cooling circuit cheaper than conventional pipe coil

CAMPOLO A 27.01.78-FR-002828

J01 (28.09.79) B01d-03/04 C11b-09/02

Heat exchanger is a condenser of the type in which the vapour is cooled as it passes through a heat transfer circuit, frequently a pipe coil, immersed in a cooling liq. usually water. Improvement is that instead of a pipe coil, the circuit now comprises a number of shallow, vertical cylindrical tanks, or compartments, spaced one above another on a common vertical axis. The compartments are connected in series by sections of pipe coil.

Each compartment pref. has a float top cylindrical wall and a coned base funneling to drain liq. into the compartment below or to discharge. The top compartment pref. has an inlet pipe supplying vapour directly from the evaporator. The complete heat transfer circuit is pref. immersed in a tank of cooling liq.

Used as a condenser in a distn. plant, partic. for the

disn. of aromatic plants and herbs for perfumes, food flavouring essences, pharmaceuticals etc. condensing circuit is cheaper to make than a pipe coil of similar cooling capacity. Improved heat transfer efficiency reduces the requirement of cooling liq. 27.1.78 as 002828 (5pp44)

Detector and electronic circuit to control redox reaction - partic. purify chromic and acid effluents from industrial process

JAEGER 30.01.78-FR-002512

J01 M11 R16 R26 (28.09.79) C02c-05/12 G01n-27/56 G05 11/08

The detector is fitted inside the reactor and comprises an electrode sensitive to the redox reaction and an associated reference electrode. Difference in potential between the sensing and reference electrodes provides a signal which actuates the circuit to regulate the rate of admission into the reactor of at least one reagent.

The reactor now also contains a second detector assembly combining a pH-sensitive electrode with associated reference electrode. The electronic circuit correlates input signals from the two detector assemblies to produce a combined output signal which regulates the rate of admission of reagent(s). The output signal is developed to represent the degree to which the redox reaction has advanced. The output signal is corrected to be independent of the pH value in the reactor, provided that the pH value lies within an acceptable range.

Used for purificn. of waste water esp. effluent from metal finishing and electro-plating factories, e.g. sodium bisulphite used to reduce hexavalent to trivalent chromium and sodium hypochlorite used to oxidise cyanide to cyanate. The redox detector does not suffer from variations in potential arising from changes in pH value of liq. to be treated 30.1.78 as 002512 (21pp448)

Steam desorption of gases from liq. - using purificn. column having two terminal zones operating at different pressures

GIAMMARCO G 27.04.78-IT-067953
J01 (07.11.79) B01d-19 B01d-53/14

Liqs. are purified by treatment with steam in a purificn. column to remove gaseous impurities. The purificn. is carried out in an initial zone of the column and then completed in two terminal zones, one of which operates at a higher pressure than the other. Heat supplied from outside is delivered to the higher pressure zone and used to purify liq. delivered to that zone.

The steam produced by this heat is extracted from the top of the zone and delivered to the bottom of the lower pressure zone to purify liq. in that zone. Liq. purified in the higher pressure zone is expanded to the pressure of the lower pressure zone to yield further steam which is delivered to the bottom of the lower pressure zone.

Efficient steam utilisation maintains the heat consumption at a relatively low level. 26.4.79 as 014600 (10pp67).

HITG ★ D15 81254B/45 ★ J5 4124-553
Incineration of e.g. urban sewage sludge - by vacuum dehydrating after adding fine coal and a coagulant, adding substance contg. calcium oxide and incinerating

BABCOCK-HITACHI KK 22.03.78-JA-031639
J09 (27.09.79) C02c-03

In incinerating sludge, urban sewage sludge, etc. is dehydrated to approx. a 65% moisture content by vacuum hydration, etc. after addn. of fine coal powder and a coagulant and a substance contg. calcium oxide, e.g., Portland cement, cement clinker, etc., is added to the dehydrated sludge in an amt. of 5-15% on the basis of the wt. of ash to be formed when the sludge is burned and incinerated.

The incineration ash formed can be solidified by wetting so that the sludge is easy to transport, can be used in land fill, and used as an aggregate. The desulphurisation efficiency is favorably c.f. other wet desulphurisation methods and thus obviates the needs for the installation of specific desulphurisation appts., etc. 22.3.78 as 031639 (2pp117)

HITG ★ D15 81255B/45 ★ J5 4124-554
Dehydration of sludge - using fine coal powder in place of slaked lime and a high polymer coagulant in place of chloride

BABCOCK-HITACHI KK 22.03.78-JA-031641
J01 (27.09.79) B01d-21/* C02c-03

In a method of dehydrating sludge using inorganic coagulants e.g. slaked lime, ferric chloride, etc., in a vacuum dehydration system, fine coal powder is used in the place of the slaked lime and also a high polymer coagulant is used in the place of the ferric chloride.

In this method, the cost of treating the sludge including dehydration and incineration, is approx. 30% cheaper than the cost of conventional methods, and also administration

costs including costs for chemicals and fuels is approx. half that of conventional methods because the method obviates the need for the installation of denitrification appts. for waste gas and hexavalent chromium reduction appts. as in the case of the conventional methods.

A high calorific, self-combustible hydrated cake can be obtained and also the amount of ash formed when the cake is burned is approx. half of that of conventional methods. In addition, the formation of harmful hexavalent chromium and the emission of offensive odors can be completely avoided. 22.3.78 as 031641 (5pp)

Asymmetric modified fluorocarbon polymer membrane prodn. - by dissolving, spreading on a sheet; evaporating solvent and pptn. in non-solvent

TECNECO SPA 27.10.76-IT-012862 (05.08.76-IT-012746)
A88 J01 (07.11.79) *DT2735-443 + B29d-07/08

membrane having a higher porosity at one surface than the other is made by dissolving a fluorine-contg. polymer in solvent, spreading the resulting soln. on a substrate, evaporating some solvent, and pptg. the polymer by immersing in a nonsolvent to produce the membrane.

The polymer is e.g. PVF, PVdF, polytrifluoroethylene, poly-1,1,2-trifluorobutadiene, polyvinylsulphofluoride, ethylene-TFE copolymer, or TFE-vinylidene fluoride copolymer. The solvent may be DMF, DMSO, THF, formamide, acetone, ethyl acetate, dioxan, a pyridine etc.

The asymmetric membranes are useful in osmosis, ultrafiltration and similar processes. They have high stability to chemicals, heat and bacteria and high mechanical resistance. 3.8.77 as 032647 (5pp945).

GIAM/ ★ D15 81176B/45 ★ GB 2019-737
Steam desorption of gases from liq. - using purificn. column having two terminal zones operating at different pressures

GIAMMARCO G 27.04.78-IT-067953
J01 (07.11.79) B01d-19 B01d-53/14

Liqs. are purified by treatment with steam in a purificn. column to remove gaseous impurities. The purificn. is carried out in an initial zone of the column and then completed in two terminal zones, one of which operates at a higher pressure than the other. Heat supplied from outside is delivered to the higher pressure zone and used to purify liq. delivered to that zone.

The steam produced by this heat is extracted from the top of the zone and delivered to the bottom of the lower pressure zone to purify liq. in that zone. Liq. purified in the higher pressure zone is expanded to the pressure of the lower pressure zone to yield further steam which is delivered to the bottom of the lower pressure zone.

Efficient steam utilisation maintains the heat consumption at a relatively low level. 26.4.79 as 014600 (10pp67).

HITG ★ D15 81254B/45 ★ J5 4124-553
Incineration of e.g. urban sewage sludge - by vacuum dehydrating after adding fine coal and a coagulant, adding substance contg. calcium oxide and incinerating

BABCOCK-HITACHI KK 22.03.78-JA-031639
J09 (27.09.79) C02c-03

In incinerating sludge, urban sewage sludge, etc. is dehydrated to approx. a 65% moisture content by vacuum hydration, etc. after addn. of fine coal powder and a coagulant and a substance contg. calcium oxide, e.g., Portland cement, cement clinker, etc., is added to the dehydrated sludge in an amt. of 5-15% on the basis of the wt. of ash to be formed when the sludge is burned and incinerated.

The incineration ash formed can be solidified by wetting so that the sludge is easy to transport, can be used in land fill, and used as an aggregate. The desulphurisation efficiency is favorably c.f. other wet desulphurisation methods and thus obviates the needs for the installation of specific desulphurisation appts., etc. 22.3.78 as 031639 (2pp117)

HITG ★ D15 81255B/45 ★ J5 4124-554
Dehydration of sludge - using fine coal powder in place of slaked lime and a high polymer coagulant in place of chloride

BABCOCK-HITACHI KK 22.03.78-JA-031641
J01 (27.09.79) B01d-21/* C02c-03

In a method of dehydrating sludge using inorganic coagulants e.g. slaked lime, ferric chloride, etc., in a vacuum dehydration system, fine coal powder is used in the place of the slaked lime and also a high polymer coagulant is used in the place of the ferric chloride.

In this method, the cost of treating the sludge including dehydration and incineration, is approx. 30% cheaper than the cost of conventional methods, and also administration

costs including costs for chemicals and fuels is approx. half that of conventional methods because the method obviates the need for the installation of denitrification appts. for waste gas and hexavalent chromium reduction appts. as in the case of the conventional methods.

A high calorific, self-combustible hydrated cake can be obtained and also the amount of ash formed when the cake is burned is approx. half of that of conventional methods. In addition, the formation of harmful hexavalent chromium and the emission of offensive odors can be completely avoided. 22.3.78 as 031641 (5pp)

Regeneration of uranium adsorbing agent - by treatment with hydrochloric acid and then with ammonia or aq. soln. of hydroxide, bi:carbonate or carbonate of an alkali metal

KINZOKU KOGYO JIGYO 22.03.78-JA-031663

E31 K05 M25 (28.09.79) B01d-15 C22b-60/22

The method comprises treating a waste uranium adsorbing agent used for recovery of uranium from sea water, and mainly consisting of titanitic acid with hydrochloric acid, the agent being reduced in its adsorbing property, and

then treating the resulting treated agent with ammonia or an aq. soln. of hydroxide, carbonate, or bicarbonate of an alkali metal to regenerate it.

In one example, a waste uranium adsorbing agent consisting of titanitic acid and ferric hydroxide was washed with hydrochloric acid of pH 1-4.5 in a vessel, and then with water. The washed agent was immersed in an aq. soln. of 1% sodium carbonate for 2 hours, and washed with water to regenerate it. The regenerated agent was packed in a column and then, sea water was passed through the packed column to absorb uranium from the sea water. 22.3.78 as 031663 (3pp)

SANK- ★ D15 81337B/45 ★ J5 4124-899
Solid waste, e.g. sludge, treatment - by carbonisation followed by use in thermite process

SANKYO YUKI KK 22.03.78-JA-031665

(28.09.79) B01j-01 C01b-31/32

Process for treating solid waste is characterised by carbonising the waste solid contg. organic components, opt. after adding calcium oxide, and then using it for the thermite process.

Waste solid may be easily treated for a short time, and the treated prod. may be effectively utilised, i.e. CO produced from the fusing reaction may be used for fuel. Fe, Al and Ca contained in the waste solid may also be recovered.

In an example, vacuum-dehydrated raw sludge (water content: 74.5%, calcium to organic component contained in raw sludge : 2%) was heated at 400 to 500°C for 3 hrs. in an electric oven to carbonise the organic materials in the waste solid. Then, 250 g of thermite agent (of which the weight ratio of metallic aluminium and ferric oxide is 1 : 3) was added to 1 kg of the carbonised material, and the mixt. was placed in a container made of iron which was equipped with a harvesting nozzle at the bottom and CO discharging opening at the top. When it was heated with a gas burner under normal pressure, after a few minutes, thermite process occurred and the temp. rose. After the process was completed, 800 g of slag contg. 2.1 g of carbide was obtd. from the harvesting nozzle at the bottom. After cooling to ordinary temp. 80 g of water was added and about 0.7 l of acetylene gas was obtd. 22.3.78 as 031665 (3pp96)

JAOR ★ D15 81367B/45 ★ J5 4125-170
Deodorising gas contg. e.g. ammonia, hydrogen sulphide, mercaptan etc. - by first scrubbing gas with basic hypochlorite soln., and then with acidic soln. to remove chlorine

JAPAN ORGANO KK 24.03.78-JA-032853

E37 (28.09.79) B01d-53/34

A gas (I) is deodorised by scrubbing (I) with basic hypochlorite soln. (III) to oxidise and absorb the malodorous gases; and scrubbing (I) contg. oxidative chlorine, generated from (III) and (II), with acidic soln. (IV).

The method can be used to remove (II) from treatment of sewage, human waste, etc. The amt. of hypochlorite consumed is less as it is used in a basic soln. The amt. of chlorine converted from hypochlorite is low.

(III) is prepd. by dissolving hypochlorous acid and a basic cpd. such as NaOH or KOH in water, and adjusting pH to > 8 . (IV) is an aq. soln. of hydrochloric acid, sulphuric acid, nitric acid, etc. In the first step, NH_3 and H_2S are converted to non-odorous cpds. and methyl mercaptan is converted to malodorous methyl disulphide. This is absorbed by into (IV) in the second step. 24.3.78 as 032853 (4pp42)

ASAG ★ D15 81368B/45 ★ J5 4125-171
Deodorisation of gas or liq. contg. oxidisable odorous cpds. - by treating with soln. contg. available bromine cpd. and water-soluble chlorine cpd.

ASAHI GLASS KK 24.03.78-JA-032855

E37 J03 (28.09.79) B01d-53/34 C02c-05/02

Deodorisation of gas (I) or liq. (II) contg. oxidisable odorous cpds. (III) and carbonate (IV), comprises (1) scrubbing (I) or mixing (II), with aq. soln. (V) contg. available bromine (VI) and water-soluble Cl-cpd. (VII), for decomposition of (III); (2) lowering the content of (IV) in (V) by addn. of HCl after the step (1) and (3) recirculating (V) after regen-

ation of (VI) and (VII) by electrolysis of (V).

The inventors had developed a method for deodorisation (I) or (II), comprising the steps (1) and (3). However, electric current efficiency in the step (3) lowers, when (V) absorbs considerable quantity of carbonate from (I) or (II). In the present method, this disadvantage is improved by adopting the step (2).

(III) is e.g. sulphur cpd., nitrogen cpd., hydrocarbon aldehyde. (VIII) is added to adjust pH of (V) to 1-6. Step (1) should be done at pH > 10. (VI) is prepd. by addn. of bromine, bromine chloride or oxyacids of bromine to water. Examples of (VII) are chlorine, chlorides or oxyacids of chlorine. The electrolysis shall be done with current density 10-30 A/dm² under voltage 3-7 V. 24. 3. 78 as 032855 (4pp42)

Treatment of waste water contg. COD and colouring material - by oxidn. using ozone, then aerobic microbiological decomposition, then further oxidn. under UV irradiation
KUBOTA KK 10.03.78-JA-028054
(29.09.79) C02c-05/04

A method of treating waste water contg. high concns. of COD and coloring matters, e.g. the secondary treated water of night soil, dyeing waste water, etc. is described. The waste water is supplied to an ozonisation tank to decompose by oxidation high molecular substances by ozone supplied from ozoniser, then the waste water so treated is subjected to biological treatment under aerobic condition by addition of air from an air compressor to decompose organic matters by means of micro-organisms, and lastly the waste water so treated is further treated with the waste ozone coming out of the ozonisation tank and an oxidising agent, e.g., chlorine gas, sodium hypochlorite, etc., while irradiating UV rays of approx. 2500 Å wave length.

This method is capable of almost completely decomposing and removing high concentrations of COD components and coloring matters in waste water at lower running cost. 10.3.78 as 028054 (2pp117)

KURK ★ D15 81567B/45 ★ J5 4125-864
Treating waste water contg. ammonia nitrogen - using combination of denitrification and digestion processes with introduction of methanol

KURITA WATER IND KK 23.03.78-JA-033227
E35 (29.09.79) C02c-01/02

In the treatment of water contg. ammonia nitrogen, e.g. waste water from ammonia and urea synthesis factories, night soil treatment plants, etc., the waste water is repeatedly treated (with return activated sludge from the final sedimentation process) in a combined system consisting of denitrification process, digestion process, and denitrification process, which are arranged in order, or in a number of alternately arranged processes consisting of digestion-denitrification processes and denitrification-digestion processes.

Part of the return activated sludge from the final sedimentation process and methanol are introduced into the final denitrification process, part of the mixed liquor coming out of the aforesaid digestion process is sent back to the first denitrification process, and the original water to be treated is intermittently charged into the denitrification processes other than at least the final denitrification process.

Method can completely remove ammonia nitrogen present in water using a greatly reduced amt. of methanol because organic material in the water are effectively utilised. 23.3.78 as 033227 (4pp117)

TEIJ- ★ D15 81569B/45 ★ J5 4125-868
Activated sludge treatment of waste water - by treating with nitric acid or nitrate, removing solids etc., and introducing into stirred tank contg. nitric acid respiration bacteria

TEIJIN ENG KK (TOKA-) 07.03.78-JA-024931
E36 (29.09.79) C02c-01/06

An activated sludge treatment for waste water contg. BOD components is new where waste water, prior to aerobic activated sludge treatment, is treated with nitric acid or nitrate, in the case where no nitric acid or nitrate is present, to regulate its pH to 6-9, then subjected to pretreatments, e.g. the removal of solids by sedimentation, etc. and finally introduced into a stirred decomposition tank with stationary filter bed where nitric acid respiration bacteria are generated and decompose and remove pollutants present in waste water.

In this method, no aeration appts. is required, BOD high load operation is possible, and treating appts. can also be made compact. And, noise problems arising from aeration appts. can be completely eliminated, bulking phenomenon resulting from BOD high load operation can be avoided so completely that stable solid-liq. sepn. can be attained. In addn. the generation of offensive odours due to the lack of oxygen can be avoided. 7.3.78 as 024931 (5pp117)

EBAI ★ D15 81750B/45 ★ J5 4127-148
Treatment of night soil-polluted water - by adding a magnesium cpd. and a phosphoric acid cpd. before or after anaerobic digestion, recovering supernatant liquor and denitrifying
EBARA INFILCO KK 24.03.78-JA-033694
(02.10.79) C02c-01/14

Advanced treatment for night soil-polluted water contg. high BOD, ammonia nitrogen ($\text{NH}_4\text{-N}$), and phosphoric acid (PO_4), comprises adding a Mg cpd., e.g., Mg hydroxide, Mg oxide, or Mg salts, and a phosphoric acid cpd., e.g., phosphoric acid or phosphates to night soil-polluted water prior to or during anaerobic digestion to complete the anaerobic digestion; sepg. digested sludge from supernatant liquor, and introducing the supernatant liquor into a biological denitrification process.

$\text{NH}_4\text{-N}$ and PO_4 present in polluted water are efficiently recovered as highly valuable fertiliser with digested sludge. The aeration power of digester is reduced because the concn. of $\text{NH}_4\text{-N}$ of liquor coming into digester in biological denitrification process following anaerobic digestion is reduced. $\text{NO}_3\text{-N}$ digest at digester in biological denitrification process is reduced. 24.3.78 as 033694 (4pp117)

NISO- ★ D15 81751B/45 ★ J5 4127-149
Treatment of waste water contg. lignin, tannin, foamable material etc. - by flotation treatment, then activated sludge etc., sepn. of foam and treatment with inorganic calcium salt
NIPPON SOLID KK 27.03.78-JA-034111
E19 (02.10.79) C02c-05

In a method of treating waste water contg. lignin, tannin, foamable substances, e.g. sewage, pulp mill waste water, paper making waste water, and other waste waters contg. inorganic and organic matters, the waste-water is first subjected to a flotation treatment using an air blowing method, a vacuum method, etc., by the addition of a foaming agent, e.g. an alkyl alcohol, an allylalkylalcohol, an allyl-alkylamine, etc., as needed, the waste water is then treated by activated sludge and/or coagulating sedimentation method, and the foams produced during the flotation treatment are separated and then treated with an inorganic calcium salt, e.g. lime milk, etc.

The method is capable not only of effectively removing lignin, tannin, and foamable substances which resist the conventional treating methods but also of BOD and COD components in a short time and by the use of smaller amts. of coagulants. 27.3.78 as 034111 (2pp117)

DAIZ ★ D15 81752B/45 ★ J5 4127-150
Treating soln. contg. organic reductive substances - e.g. hydrazine, hydrazide, formic acid, oxalic acid etc., by adding oxygen and passing through cylinder packed with metal catalyst
DAIDO TOKUSHOKO KK 27.03.78-JA-035093
E19 (02.10.79) C02c-05/04

Oxygen is first dissolved in soln. contg. the organic reductive substances. The soln. with oxygen is then passed through a cylinder filled with a metal catalyst, prep'd. by depositing, adhering, or coating a powdered metal, e.g., Fe, Co, Ni, Pt, Rh, Pd, Mo, W, etc., onto a medium, e.g., sand, glass, activated carbon, alumina, plastic, etc., from its lower side. The soln. deprived of organic reduc-

the substances is exhausted through an exhaust pipe at the top part of the cylinder.

Damage to metal catalyst by mechanical impact such as injection of oxygen or oxygen-contg. gas can be prevented because of the sepn. of oxygen dissolution process from metal catalyst contact process. An equilibrium is formed between the feed speed of soln. and the specific density of metal catalyst and thus automatic sepn. of soln. treated from metal catalyst is attained. 27. 3. 78 as 035093 (5pp117)

Treatment of hydroxide residue from water purificn. plants - by condensation, recirculated hot gas treatment, dehydration calcination and acid treatment for coagulant regeneration

COMMUN WATER SUPPLY 10.03.77-SU-460845

E33 (25.02.79) C02c-03

Hydroxides obtd. on purifying water are treated by condensation, mechanical dehydration, calcination of the residue, and conversion of the solid to $\text{Al}(\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$ with acid.

The process can be simplified and the cost of coagulant regeneration is reduced by 30-35%, by elimination of the processes of condensation in a separator followed by freezing and thawing of the residue prior to dehydration.

The hydroxides are condensed by stirring, heated to 40-100°C by waste heat from the gases from the calcining stage, and then dehydrated mechanically.

The indirect use of the waste gases eliminates the need to clean them. The process requires less apparatus and less energy input, and consequently costs less to operate, than the previous method.

Non-coagulated polymers are removed from latex industry effluent to a greater degree by using 3.0-16 mg. of acrylate latexes per l of effluent. In an example, to 1l, effluent contg. 3g/l SKI-3 latex are added 49 mg. divinyl-methacrylate latex. The whole is mixed for 5 min. after which 100 mg $Al_2(SO_4)_3$ are added. The non-agglomerated rubber crumb is filtered off. The amount of suspended polymers remaining in water amounts to 28 mg/l. corresponding to 99.07% purification.

$Al_2(SO_4)_3$ acts as coagulant, while the acrylate latexes prevent agglomeration of rubber coagulate.

Phenol-formaldehyde resin aq. effluent treatment - using adsorbent, with catalyst polycondensation and sepn. for improved monomers removal

URALS FORESTRY INST 01.03.77-SU-457381
A21 E14 (A35 E17) (25.02.79) C02c-05/02

PhOH and HCHO are removed from phenol-formaldehyde resin industry aq. effluent by adding an adsorbent, a

catalyst and subsequently polycondensing the sepn.

A rapid, simple one-stage process is conducted as follows: condensation is conducted using an efiluent: adsorbent: catalyst ratio= 33.3: 100:0.2 - 195:100:9.5.

The liquid is stirred with staggered energy rise: 40-120 kw for 8-20 min. then 100-300 kw. until the procedure is complete.

Solar still for desalination of salty desert water - contg. inclined heat pipe parallel to transparent plastic film window with horizontal section in water container

AS TURK PHYS TECH 12.06.72-SU-795738
A88 Q74 (25.02.79) C02b-01/02 F24j-03/02

The thermal efficiency of the solar still used in desert and other dry regions with hot climate, is ensured by use of condensation heat for preheating the water in the still container.

The still contains heat pipe mounted in parallel to the inclined transparent window, e.g., made from polyethylene film, and having its working section immersed in the water to be distilled. The vertical surface on which the vapour condensates is a wall of the upright chamber filled with water to be distilled which is thus preheated. The distillate is collected in the trough fixed to the wall and flows to the outlet nozzle.

Halogenation of water - by passing electrolysis current through anode and cathode defining electrodc gap for water flow

ORONZIO DE NORA IMP 11.05.78-IT-023283

E36 J03 (30.10.79) C02b-01/82

Water is halogenated by passing an electrolysis current through a porous permeable anode and a cathode defining an electrodc gap. An aq. soln. of an alkali metal halide contg. ≥ 25 g/l of the halide is passed through the anode into the gap and the hydrodynamic flow through the anode controlled to maintain the wt. ratio of active halogen to halide in the water leaving the gap at ≥ 0.2 .

Used for sterilising water for potable water systems or swimming pools.

The halogenation process can be operated at a high current density, e.g. $4000-5000$ A/m², with a Cl₂ discharge current efficiency higher than 85%. This increases the anode lifetime because the anodes are not subjected to excessive O₂ evolution which reduces the catalytic activity of their noble metal oxide coating. 31.7.78 as 929494 (11pp67)

ASAH D15 24200A/13 =US 4172-779

M11 (30.10.79) *NL7804-692 C25d-17/10 + C25d-17/06 C25d-21/10

Electrolytic treatment of metal contg. waste waters is described using an anode and multiple cathodic rods. The rods are held parallel to each other using two movable holding devices which allow the rods to be moved relative to each other. Pref. the rods are held in a cage like structure which rotates allowing individual rods to fall against each other.

This action serves to detach surface deposits of metal obtained by the electrolysis. At the base of the chamber conical surface feeds into a collecting zone from which the deposits can be removed.

The design allows the anode-cathode spacing to be reduced thus reducing the electrical energy required. Thus continuous operation is possible without excessive heating up. on dilute metal contg. solns. 3.8.78 as 930648

D/S: N(CH, DK, DT, GB, JA, SU, SW, US) + E (FR).

The liquid is raised by an axial-pump impeller through a vertical riser whose lower end forms an inlet for the liquid and whose upper end forms an outlet. At the upper end guide surfaces deflect the liquid radially from the axis of the riser.

The drive shaft of the pump impeller extends coaxially within the riser line, from a drive unit located above the liquid, to the impeller. The drive shaft is enclosed by a stationary line whose inner wall defines together with the drive shaft, a gas passage whose lower end opens into the riser via a passage extending radially to the centre line. The gas passage communicates at its upper end with a gas source such as the surrounding atmosphere.

The apparatus is primarily intended for the oxygenation of sewage water in biological purification works.

The apparatus operates efficiently and provides a higher liquid velocity than using prior art apparatus. The axial liquid flow is uniform over the whole flow area.

Regenerating liq. filters by automatically initiated program incorporating unclogging of elements by ultrasonic waves sedimentation and discharge of dislodged particles

BERTIN & CIE (POTI/) 05.04.78-FR-010041

J01 K07 (01.11.79) B01d-27 B01d-35/20 C02c-05

D/S: N(JA, US) + E(DT, GB, SW).

A process for regenerating filtration appts., esp. liquid filters comprises three successive phases. The first phase is an unclogging phase. The second phase is a sedimentation of the particles coming from the unclogging. The third phase is the discharge of the sediments.

The process is initiated automatically when the pressure drop through the appts. has reached a predetermined value, and takes place according to a cycle. The unclogging is brought about by ultrasonic waves transmitted to the body of the fluid in the filtration appts.

The method obviates the need for frequent changing of filter cartridges, thus making the process suitable for filtering contaminated material, e.g. in the secondary circuit of a nuclear reactor. It also allows the filter to be regenerated without dismantling or manual handling, does not need a large flow of fluid and allows direct discharge of the sediments at the end of the regeneration cycle, immediately downstream of the filtration equipment.

Protecting sugar beet against damping off - using dry compsn. contg. Pythium oligandrum Drechsler oospores to treat seeds

VU ROST LINNE ROBY 05.07.78-CS-004462

C03 P11 (05.11.79) A01c A01n

Compsn. comprises a dry, powdered substrate, (pref. grain or maize) fermented with Pythian oligandrum Drechsler and contg. $\geq 10^6$ (pref. $50-500 \times 10^6$) oospores, per g.

Compsn. is prepd. by culturing P. oligandrum Drechsler on a substrate wetted with liq. nutrient medium to give

the above oospore count, then drying and milling at $\geq 35^\circ\text{C}$. Pref. the substrate, contg. 2-3% CaCl_2 as well as usual components (e.g. sugars, maize steep liquor and mineral salts), is spread out on a flat surface and irradiated during fermentation with visible light using blue or green filters.

When applied to sugar beet seeds, the compsn. stimulates growth of seedlings as well as preventing damping off. Compared with liq. oospore suspensions previously used, the compsns. have a higher oospore concn. and are more storage stable. The compsns. adhere well to seeds, requiring little or no adhesive. 4.7.79 as 877474 (12pp941)

(31.10.79) *BE-846-713 C05f-09

Refuse or mixtures of refuse and sewage sludge are turned to compost by removing unsuitable components by screening and dumping the rest in shallow stockpiles in which adequate aeration cavities are left. Cavities, shaped like gothic arches and extending half or three-quarter way up the pile thickness are arranged throughout the length at a distance of 1-1.5m from each other. They are produced by perforated sheet metal structures on wheels.

Other holes extend parallel to them, offset and a little above the points of the arches. Vertical short holes are also provided on the pile surface.

This allows the compost to ripen without putrefaction.

Testing chamber for bio-hazardous substance falling as droplets with air curtain preventing escape of droplets

COULTER ELECTRONICS INC 26.04.78-US-900103

B04 J04 P43 (07.11.79) B08b-15 B08b-21/22

A testing chamber includes an analysis and sorting system in which a sample liquid is converted into droplets which are electrically deflected into a number of collection cells depending on their characteristics. The front wall of the test chamber is open and to prevent the escape of droplets from the test chamber a negative pressure is maintained with the chamber. Ambient air is drawn into the chamber by the negative pressure at a rate which would normally interfere with the droplet deflection process.

A baffle is placed behind the droplet stream on the side away from the open wall of the chamber and this creates a region of stagnant air which includes the droplet deflection system.

The appts. sorts droplets formed from a sample e.g. during cytology or haematology. The baffle allows a negative air pressure to be used to prevent escape of droplets yet does not interfere with the sorting process. 24.4.79 as 014192 (7pp295).

Glutamic acid dehydrogenase prepn. - by cultivating Proteus microorganisms e.g. IFO 12930, IFO 3849, IFO 3045 etc.
CHUGAI PHARMACEUTICAL KK 22.03.78-JA-031632
B04 (02.10.79) C12d-13/10

prepn. of glutamic acid dehydrogenase comprises culturing a glutamic acid dehydrogenase producing microorganism belonging to the Proteus genus in a cultivation medium, and recovering the glutamic acid dehydrogenase from the obtained cells.

Method of cultivation can be either liquid or solid cultivation. For commercial prodn. submerged cultivation with aeration and stirring is used. The cultivation temp. is pref. ca. 30°C for 15-30 hours. The pH of the medium is initially 7-8. Extraction of the enzyme can be carried out conventionally.

By using glutamic acid dehydrogenase it is possible to measure glutamic acid, alpha-ketoglutaric acid and ammonium. The glutamic acid dehydrogenase therefore is potentially useful in clinical diagnosis. For example, it is possible to determine transaminase activity (GOT, GPT, AST, ALP). The glutamic acid dehydrogenase is stable, e.g., when stored at 0-5°C in the form of suspension of suitable salt such as ammonium sulphate, it maintains 100% activity even after 1 month. The enzyme oxidises glutamic acid to form alpha-ketoglutaric acid and ammonia. 2. 3. 78 as 031632 (4pp108)

Seishu rice liquor prepn. - using powder scraped from surface of rice grains, and refined sugar soln.
HIGASHIKOMA GIJUTSU 25.12.75-JA-154108
(11.10.79) *J52079-088 C12g-03/02

Prepn. of seishu (Japanese liquor prepd. from boiled rice), comprises adding refined sugar soln. of D.E. 50-95 in the last stage of fermentation, which is carried out by hydrolysis of rice malt with the addition of liquefying amylase to shiro-nuka (powder scraped off from the surface of rice grain. About 20% of rice grain is scraped off as 'shiro-nika' generally for mfr. of seishu).

Yield of seishu is increased by using shiro-nuka as raw material. The saccharified soln. of shiro-nuka, refined by removing impurities in it, contains glucose as principal component, disaccharides such as maltose and water-soluble oligosaccharides having high mol. wts., and gives good sweetness to seishu. 25.12.75 as 154108. Aerodynamic foam breaking unit - uses spiral gas flow in cylindrical chamber with axial inlet for foam, used in chemical and microbiological industry

BELOUSS KIROV TECHN INS 18.03.77-SU-464470
J01 (25.02.79) B01d-19/02 C12b-01/18

The efficiency of foam breaking is enhanced by swirling the gas stream in the cylindrical chamber when flowing at a velocity of 15-30 m/sec. The foam is admitted along the axis of the cylindrical chamber in the depression zone formed by the gas stream.

The bubbles of the foam subject to pressure gradient and to centrifugal forces exceeding the gravitational pull impact the wall of the chamber. This breaks up the bubbles and the separated fluid is thrown to the wall where it is entrained by the gas stream.

Bovine milk xanthine oxidase isolation and purification - by process which includes incubation with non ionic detergent and ultrafiltration

UNIV OF DELAWARE 15.06.77-US-806736
B04 (30.10.79) C07g-07/02

Xanthine oxidase (XO) from cows' milk is isolated and purified by incubating the milk in the presence of sodium salicylate, ethylenediaminetetraacetate and a phosphate buffer and then adding a non-ionic detergent to the milk and letting it incubate for a shorter period of time, reducing the temp. to stop incubation and adding sufficient ammonium sulphate to precipitate the caseins but not the XO, separating the caseins and other solids and adding sufficient ammonium sulphate to precipitate the XO, separating the red-brown precipitate, dissolving it in Tris/CaCl₂ buffer, storing the soln. at freezing or below for ≥15 hrs., thawing the mixture and removing the solid, filtering the liquid with an ultrafilter which will retain molecules of > 50,000 daltons, applying the concd. retained material on an equilibrated chromatographic column, eluting the column with a buffer soln., collecting the eluent in multiple fractions, testing these for XO activity and combining the active ones, and continuing this process with chromatographic columns of varying characteristics until the desired XO purity is obtained.

XO catalyses the oxidation of many purines, pteridines, aldehydes and other heterocyclic cpds. by a number of electron acceptors such as oxygen, NADH, dyes, ferricyanides and cytochrome C. The presence of XO in excess or its absence, inhibition or stimulation reflects on the biochemistry of normal or abnormal cellular activity. Also, XO in bovine milk is a factor in the development of atherosclerosis in humans. The production of high purity XO will stimulate research in these fields and may lead to clinical and industrial applications. 15.6.77 as 806736 (5pp476)

Modification of enzyme characteristics - by using a soluble complex with substance having hydrophobic and functional part

SVENSKA SOCKERFAB AB (MART/) 03.04.78-SW-003732
B04 (01.11.79) C07g-07/02

D/S: N(DK, DT, GB, JA, US).

Enzymatic process is effected by using an enzyme in the form of a soluble complex. The enzyme is bound to a substance having a hydrophobic part and a functional part for modifying the kinetic productivity characteristics of the enzyme.

Enzymes possessing different types of catalytic activity can have most functional gps. introduced by a mild technique that is simple and economic but is sufficiently effective to give adequate binding of the substance to the enzyme. The enzymes are used in washing agents, in tanning, in pharmaceuticals prodn., in analytical procedures, etc.

D/S: N(BR, JA, SW) + E(CH, DT, FR, GB).

(A) Determination of a component of a specifically binding pair comprising a ligand (e.g. an antigen) and its homologous receptor (e.g. antibody) uses a test system comprising

(a) an aq. medium;

(b) uniformly dispersed solid particles to which a component of the ligand-receptor pair is coupled, forming a particle conjugate which creates around it a local environment different from the bulk medium;

(c) a signal-producing system capable of producing a measurable signal which depends on the extent to which the signal-producing system is present in the environment of the particle conjugate;

(d) a signal-indicator conjugate comprising at least one component of the signal-producing system coupled to a component of the ligand-receptor pair, whereby the amt. of signal-indicator conjugate bound to the particles is related to the amt. of analyte in the aq. medium.

If the analyte is a 1st receptor, the component coupled to the particles can be the homologous ligand or a receptor for the 1st receptor, and the component forming the signal-indicator conjugate can be the receptor for the 1st receptor or its homologous ligand.

The method comprises (1) contacting the sample with the aq. medium contg. (i) the particle conjugate, (ii) the signal-indicator conjugate, (iii) the homologous component of the ligand-receptor pair (if the analyte, particle conjugate and signal-indicator conjugate all comprise the same component of the ligand-receptor pair) and (iv) any other components of the signal-producing system; and (2) comparing the observed signal with a standard.

(B) Novel particle conjugates comprise at least one ligand mol. and at least one enzyme mol. covalently bonded to porous particles with a dia. of 50nm to 100 μ m. Other novel conjugates comprises a 1st enzyme and a component of a ligand-receptor pair coupled to a porous particle, to which is non-covalently bound (by ligand-receptor interaction) the other component labelled with a 2nd enzyme, such that the product formed by one of the enzymes is the substrate for the other.

(C) Phosphate-substd. glycosidyl ethers of umbelliferone and its derivs. are new.

No separation or segregation is required in the analysis. 2.4.79 as US0202(113pp367).

Clarifying raw sugar soln. - by mixing with aq. chitosan soln. to aggregate particles

NANSEI TOGYO KK 21.10.75-JA-125887

(11.10.79) *J52057-342 C13d-03

Suspensoids comprise (e.g. organic colloids, inorganic colloids, cellulose, slaked lime and other fine particles). Flocculant is added to the soln. to sediment the aggregates and obtain a clear supernatant which is opt. filtered.

Chitosan obtd. by deacetylising chitin and though insoluble in water, is soluble in acid-forming salts. For example, crab shell is demineralised, deproteinised, washed with water and dried, and obtd. chitin is deacetylsed, washed with water and dried. Chitosan is dissolved in water in the presence of acid and the soln. is added 1-100 ppm. pref. 2-50 ppm. (solid wt./vol. of raw sugar soln.).

Using chitosan large clarifier and filter station are unnecessary. Nonsugar content in raw sugar soln. can be decreased and the recovery of sugar can be increased. Excellent clarity is obtd. and addn. of lime to the top layer before filtration is unnecessary. Because of good filtrability the amt. of washing water for the filter cake can be decreased and steam consumption can be saved. Because of good filtrability the interval of replacing filter cloth can be prolonged. 21.10.75 as 125887. C13d 3/00 (11.10.79) NANSEI TOGYO KK (4pp) (J52057342)

Preserving fresh hides e.g. pig skins - by treatment with dry salt and antiseptics in rotating, hermetically closed drum at specified speed with brine removal

IVANKIN M T 28.03.77-SU-471331

(28.02.79) C14c-01/02

Fresh hides are preserved by treatment with dry salt and antiseptics in a rotating, hermetically closed drum.

The process is accelerated and the consumption of chemicals is reduced by applying the critical speed of the drum rotation and 100%- loading (i.e., complete filling of the drum with hides)

level phospho-betaine(s) and phosphitaine(s) - used as surfactants
sp. suitable for toilet compsns.

JOHNSON & JOHNSON (MONA-) 30.11.78-US-965462
(05.05.78-US-902121)
A97 E11 (D25) (05.11.79) C07f

The cpds. have the formula (I) or (II) below: in which A is
O⁻, -OM or -O-Y-R⁺; B is -O⁻ or -OM'; X is an

(I)

(II)

anion; Z is 0-2 and is sufficient for
electroneutrality; R is a group of
formula $\text{R}_1-\text{CO}-\text{N}(\text{R}_2)-(\text{CH}_2)_n-$
 $\text{N}(\text{R}_3)(\text{R}_4)-\text{Z}^{\oplus}$; R₁ is 5-22C alkyl,
alkenyl, alkoxy, or hydroxyalkyl or
up to 20C aryl or alkaryl; R₂ is H

or up to 6C alkyl, alkenyl or hydroxyalkyl or cycloalkyl,
pref. 2-5C, or up to 10C polyoxyalkylene; R₃, R₄ are each
up to 6C alkyl, hydroxyalkyl or carboxyalkyl or up to 10C
polyoxyalkylene, or from an N contg. heterocycle with the
N atom linked to Y other than by the N atom; n is 2-12; or
R is a heterocyclic group of formula (III) above in which Z
is N, S or O; o is 0-3, p is 1-3 and o+p is 3-4, R₁ as above
is linked to a C atom, R₆ = 2-6C alkyl or hydroxyalkyl; Y is
up to 12C alkylene opt. interrupted by up to 3 O atoms and
opt. substd. by up to 10C lower alkyl, alkoxy, hydroxyalkyl,
or hydroxy; M and M' are each (a) H, alkali or alkaline
earth metal, mono- di- or tri-ethanolamine or (b) up to 6C
alkyl or hydroxyalkyl, up to 10C polyhydroxyalkyl, gly-
ceryl, up to 6C cycloalkyl, or up to 10C aryl or arylalkyl
provided if one of M, M' is a radical (b), the other is one
of (a).

The cpds. are used as surfactants. They are highly ef-
fective, very stable, extremely tolerable for human tis-
sue, and have a very low ocular irritation and toxicity by
oral means which makes them very suitable for toilet

JOHJ ★ D21 80843B/45 ★ BE-876-056
Detergent and cleaning compsns. esp. shampoos - contg.
phospho-betaine(s) or phosphitaine(s) and a specified amphoteric
cpd.

JOHNSON & JOHNSON 30.11.78-US-965460
A97 E11 (D25) (05.11.79) C11d

The compsn. contains as active constituents (a) 1-20% of
a cpd. of formula $\text{RCONH}(\text{CH}_2)_x-\text{N}(\text{R}_1)-(\text{CH}_2)_{x'}-\text{COOM}$
(where R is 8-18C alkyl, R₁ is 2-4C hydroxyalkyl or
-CH₂OCH₂COOM; x and x' are each 1-5 and M is H or an
alkali metal), and (b) 1-20% of a cpd. of formula

$\text{R}^{\oplus}-\text{Y}-\text{O}-\text{P}(\text{O})(\text{A})(\text{B})\text{X}_z^{\ominus}$ (I).
In (I) A is -O⁻, -OM or -O-Y-R⁺; B is -O⁻ or
-OM'; X⁺ is an anion; z is 0-2 such that the cpd. is elec-
troneutral; R is a group of formula $\text{R}_1-\text{CON}(\text{R}_2)-(\text{CH}_2)_n-$
 $\text{N}(\text{R}_3)(\text{R}_4)-\text{Z}^{\oplus}$ in which R₂ is H, up to 6C alkyl, alkenyl,
hydroxyalkyl or cycloalkyl, pref. 2-5C, or up to 10C poly-
oxyalkylene; R₃, R₄ are each up to 6C alkyl, hydroxyalkyl
or carboxyalkyl or up to 10C polyoxyalkylene or R₃, R₄
and the N atom form an N-heterocycle not attached to Y by
the N atom; n is 2-12; or R is a radical of formula (II)

in which Z is N, S or O; o is 0-3, p
is 1-3 and o+p is 3-4; R₁ is attached
to a C atom; R₆ is 2-6C alkyl or
hydroxyalkyl; Y is up to 12C alkyl-
ene opt. interrupted by up to 3 O
atoms and opt. substd. by alkyl,

alkoxy, hydroxy or hydroxyalkyl up to 10C; M, M' are (a)
H, alkali or alkaline earth metal, mono-, di- or tri-
ethanolamino or (b) up to 6C alkyl, hydroxyalkyl or up to
10C polyhydroxyalkyl, glyceryl, up to 6C cycloalkyl and

up to 10C aryl or arylalkyl provided if one of M and M' is
(b) the other is one of (a); or a phosphitaine of formula:
 $\text{R}^{\oplus}-\text{Y}-\text{O}-\text{P}(\text{O})-(\text{H})(\text{O}^-)$, provided the sum of (a) + (b) is
not above 35% of the compsn.

The cpds. are used mainly in shampoos and also
skin cleaning compsns., foam baths, baby baths, etc. The
cpds. are non-irritating or very slightly irritating to the
eye and skin. In shampoos, they have good foaming proper-
ties and leave the hair shiny, supple and easy to comb.

(27.02.79) A61k-07/13

Hair dying tablets, useful in perfumery and cosmetics industry, are based on vegetable source henna or black dye material. The dye tablets are prepd. by mixing fragmented and dried raw material, e.g. henna plant, with powdered soap and tea extract for 10-15 mins. followed by rapid cooling to 20-25°C, further mixing for 3-5 min., and pressing mixt. into tablets. The tablets are then heat-treated for 12-15 min. at 37-40°C to remove surface moisture. They have improved compact

appearance, and they can be prepd. by a mechanised process. Zurabishvili, G.G., Machkhin, Yu.A., Margvzlashvili, D.A. Bul. 7/25.2.79. 27.10.77. as 538689 (2pp938)

Adhesively attaching pontic tooth or fixed bridge to adjacent teeth - using thin conformable screen applied to surface of adjacent tooth, and using curable liquid dental adhesive

LEE PHARMACEUTICALS 06.05.77-US-794544

A96 G03 P32 (A14 A23) (30.10.79) A61c-13/30

A pontic tooth or fixed bridge is adhesively mounted in place on the previously prepared support surfaces of abutment teeth in the mouth. The process comprises applying to the previously prepared surfaces a liq. dental adhesive which wets the surfaces, to insure good bonding. A screen of thickness ≤ 1.0 mm is then applied to each support surface, the screen being of a material which conforms readily to the shape of the surface. Adhesive is then applied between the pontic tooth or fixed bridge and the screen, and the tooth or bridge is held in its desired final position while the adhesive cures.

A mechanically strong bond is formed, so that the pontic tooth or fixed bridge can withstand chewing forces. 6.5.77 as 794544 (7pp914)

Deodorisation of gas contg. basic and acidic organic cpds. - by scrubbing with sodium hypochlorite and simultaneously catalytically oxidising, then treating with active carbon and zeolite
OSAKA SANSO KOGYO K 24.03.78-JA-033705
E34 (28.09.79) B01d-53/34

A method for deodorisation of gas (I) contg. basic and acidic organic cpds., comprises (1) scrubbing with sodium hypochlorite soln. (II) and catalytically oxidising, (I) simultaneously and (2) treating (I) with active carbon and zeolite after the step (1).

By scrubbing (I) with (II) and catalytically oxidising (I) simultaneously, hydrogen sulphide and ammonia in (I) can be removed with little consumption of (II), according to the following reactions: $H_2S + NaClO = S + NaCl + H_2O$ and $2NH_3 + 3NaClO = N_2 + 3NaCl + 3H_2O$.

As catalyst for the step (2), nickel peroxide or mixt. of active carbon and zeolite are used. Sodium hypochlorite, chlorine gas and ozone are contained in the (I)-step-treated gas and they are adsorbed to active carbon and zeolite. In the present method, sodium hypochlorite is regenerated from NaCl formed by the decomposition of hydrogen sulphide and ammonia. 24.3.78 as 033705 (6pp42)

Sterile solid compress for application to discharging wounds - contg. sodium chloride and zinc salts to stimulate wound healing

MOLNLYCKE AB (NORD/) 03.04.78-SW-003697

B06 E34 P34 (E32) (01.11.79) A611-15/*

D/S: N(GB, US) + E(DT, FR).

Sterile, solid, dry compress for the treatment of discharging wounds contains NaCl and/or Zn salt(s).

In use the salt(s) affects the wound bottom directly and stimulates wound healing and by osmotic forces causes secretion from the wound, and this is absorbed by the solid dry compress. The dry compress only requires to be changed twice daily, in contrast to the usual moist NaCl compress, which requires 3-6 changes daily; also the solid, dry complex is more easily handled. There is also an antibacterial effect and inflammation risk is decreased.

Linalool prodn. from O-linalyl N,N di:methyl:hydroxylamine - by
hydrogenating in presence of catalyst prepd. by adding e.g.
aluminium, antimony and/or sulphur to nickel or cobalt
NISSAN CHEM IND KK 20.03.78-JA-032033
B05 E16 (29.09.79) B01j-23/74 C07c-33/02

B05 E16 (29.09.79) B011-23/74 CO/C-33/02

Prod'n. of linalool (II) comprise hydrogenating O-linalyl-N,N-dimethylhydroxylamine (I) under hydrogen pressure of 30 kg/cm² in the presence of a multi-element reducing catalyst which is prep'd. by adding ≥ 1 of Al, Ge, As, Sb, S, Se and Cr to Ni or Co.

(II) is useful as perfume or as a starting material to vita-
mins. In the prior art, catalytic hydrogenation of (I) to (II) failed because the 1,2-double bond was readily hydrogenated. By using the catalyst, the saturation of the 1,2-double bond can be avoided.

When the element to

CN(C)O[C@H](C)(C)CC=CC(C)=CC(C)C

(I) as a starting material to vita-
mins. In the prior art, catalytic hydrogenation of (I) to
(II) failed because the 1,2-double bond was readily hydro-
genated. By using the catalyst, the saturation of the 1,2-
double bond can be avoided.

The catalyst is prepd. as follows. When the element to be added to Ni or Co is Al, Ge, Sb or Cr, $\text{Ni}(\text{NO}_3)_2$ or $\text{Co}(\text{NO}_3)_2$ is held on a carrier together with the nitrate of the metal in a predetermined ratio, then burned and preliminarily reduced. When the element to be added is S, Se or As, an aq. soln. of Ni salt or Co salt is mixed with a proper carrier, added a base (hydroxide or carbonate), then added an aq. soln. of $(\text{NH}_4)_2\text{SO}_4$, H_2SeO_3 or H_3AsO_4 , evaporated to dryness, then burned and preliminarily reduced. 20.3.78 as 032033 (3pp52)

Preventing brownish discolouration of phospholipid during heating
- by adding acidic aminoacid and basic aminoacid salt mixt., giving
prod. with superior surfactant and hypocholesterolaemic effect
HOHNEN OIL KK 25.03.78-JA-033963
B04 (01.10.79) A23d-05/04 C11b-05

A process for inhibiting brownish discoloration of a phospholipid at its heating step is claimed in which in the event of heating a fatty oil contg. ≥ 0.2 wt. % dissolved or dispersed phospholipid at $\geq 150^{\circ}\text{C}$, a salt mixt. consisting of acidic amino acid and basic amino acid is added in the fatty oil contg. the phospholipid, prior to the heating step or in the intermediate heating step and thereby, the brownish discoloration of the phospholipid is prevented.

The phospholipid comprises soyabean phospholipid, corn phospholipid, cotton seed oil phospholipid and rape seed oil phospholipid. The fatty oil comprises soyabean oil, Indian corn oil, cotton seed oil, rape seed oil, sesame oil, sunflower oil, peanut oil, palm oil and coconut oil. The salt mixt. of acidic amino acid and basic amino acid is chosen from a salt of alginine-glutamic acid, a salt of lysine-glutamic acid or a salt of lysine-aspartic acid.

The above phospholipid has a superior surfactant effect and it acts to reduce the content of cholesterol in blood soln. 25.3.78 as 033963 (2pp15)

HOHN ★ D23 81771B/45 ★ J5 4127-408
Heating phospholipid dissolved or dispersed in fatty oil - by adding sodium glutamate to prevent browning, used in food and feed, cooking, medicine, etc.

Sodium glutamate is added to the fatty oil contg. ≤ 0.2 wt. % phospholipid as a solute or dispersion before or during heating. It is added in an amt. > 3 (> 20) wt. % of the phospholipid.

Pref. the phospholipid is of soybean, corn, cotton seed, rape seed, etc.; and the fatty oil is bean oil, corn oil, cotton seed oil, rape oil, sesame oil, sunflower oil, palm oil, hardened oil, butter, margarine, shortening, beef fat, lard, etc.

Browning, which is caused by heating fatty oil contg. phospholipid at $> 150^{\circ}\text{C}$, is restrained. Field of use of the phospholipid is widened..27. 3. 78 as 035149 (2pp170)

Packaging fragile moulded prods., e.g. perfume releasing articles -
by placing preformed resin sheets into a mould, pouring the molten
prod., closing the mould and solidifying the prod.
KOBAYASHI NOKO 27.03.78-JA-035055
A92 (03.10.79) B29c-05/04

Into mould sets, preformed resin sheets each having raised patterned portion complementary to the shape of each mould set and flat portion extended around the raised portion are placed in the mould sets in position so that flat portions are piled together. A molten forming compsn. having lower m. pt. than that of the preformed resin is poured between the preformed resin sheets. The registered mould sets are pressed together to seal the resin sheets together and turned to form the molten mixture centrifugally until the mixture has been solidified.

In an ornament for evaporating perfume for a prolonged period, the moulded compsn. comprises paraffin wax for sustaining the shape, stearic acid for releasing perfume contained in the compsn. and perfume. The inclusion of stearic acid reduces the strength of the moulded compsn. It is thus preferable to coat the surface thereof with resin sheet integrally by the process.

The process provides moulding and packaging of a fra-

gile moulded product to prevent damage during moulding, transportation and use. 27.3.78 as 035055 (4pp59)

Vegetable oil primary cleaner - uses scraper sieve and sedimentation followed by centrifuge to improve mechanical impurities removal

VINNITSA OIL FAT 11.01.77-SU-444055

(28.02.79) C11b-03/16

Improved cleaning of vegetable oil from mechanical impurities at lower power costs is achieved by stages with the first one removing particles of 1-3 mm size. The second stage separates particles greater than 0.015-0.02 mm, and the third stage uses centrifugal straining with filtering layer formed by particles removed in the second stage.

The oil expressed from plants is fed to scraper conveyor fitted with a mesh bottom for the efficient removal of particles with diameter of 1-3 mm, and followed by a settling unit for eliminating small particles of the cake. The oil is then pumped to the auger-type straining centrifuge, a rotameter controlling oil addition when forming the filtration layer.

Control of sepn. of free-flowing oil-contg. material into fractions - by varying electric field strength according to deviation of inter-electrode gap conductance from set value

FOOD IND AUTOMATION 20.12.76-SU-432674

J01 P41 (04.04.79) B03c-09

The previous automatic control process for sepn. of free-flowing materials into fractions, mainly in an electrostatic extractor, involves varying the electric field strength. For more effective extraction, the electric conductance of the medium in the inter-electrode gap is determined, and the field strength is varied according to any variation from set conductance. This increases the mean field strength and avoids stoppages in extraction of oil-contg. materials in oil and fat production.

(R_1-R_6 are H, 1-20C alkyl, alkoxy, phenyl or halogen; R_1 and R_2, R_3 and R_4, R_5 and R_6 may combine to form benzo radical). Typical cpds. used are N-salicylidene-N¹-salicylhydrazide, oxalobis-(salicylidenehydrazide), oxalbis-(2-hydroxy-5-methylbenzylidenehydrazide), etc.

Addn. of the compsns. in amts. of 0.001-5 pts. wt. to 100 pts.wt. of powder detergent improves the stability of inorganic peroxides, prevents lowering of the effective oxygen content by decompsn. during storage and helps maintain the bleaching effect. 4.6.75 as 067270.

C11d 3/32 (16.10.79) KAO SOAP KK (5pp136) (J51143012)

KAOS D25 06798Y/04 = J7 9032-647
Bleaching detergent of excellent storage stability - contg. inorganic peroxide and chelate resin having copolymer of styrene and divinyl benzene as skeleton with polyaminoethyl functional gp.

KAO SOAP KK 06.06.75-JA-068328

A97 (A13) (16.10.79) *J51144-407 C11d-03/37

The chelate resin of formula (I):

(where n is ≥ 1) is obtd. by treating styrene-divinylbenzene copolymer with methyl chloromethyl ether in the presence of catalyst such as $ZnCl_2$, and further treating with polyethylenepolyamine. The chelate resin is added at 0.001-5 pts.wt. per 100 pts.wt. of bleaching detergent.

Inorganic peroxide is $2Na_2CO_3 \cdot 3H_2O_2$, $NaBO_3 \cdot 4H_2O_2$, $Na_4P_2O_7 \cdot 3H_2O_2$, etc., which is added at 1-50wt. % (pref. 5-30wt. %) on the detergent.

The detergent has pure white colour and excellent appearance. 6.6.75 as 068328. C11d 3/37 (16.10.79)

KAO SOAP KK (3pp) (J51144407)

KAOS D25 17004Y/10 = J7 9032-648
Liq. bleaching detergent compsn. - contg. microbially decomposed surfactant and alkali metal hypochlorite

KAO SOAP KK 14.07.75-JA-085961

E12 (E34) (16.10.79) *J52009-006 C11d-03/24 C11d-10/02 + C11d-01/14

The compsn. contains 3-7wt. % alkali metal hypochlorite and 0.5-8wt. % $R_1-CH(R_2)-CH_2OSO_3M$ (where R_1 and R_2 are 1-12C alkyl having a total no. of C of 8-14; and M is Li, Na or K).

If the concn. of alkali metal hypochlorite in the aq. soln. is too high, the solubility of the surfactant may be reduced. The extent of the redn. of effective chlorine may also be larger when the compsn. is preserved for a long time.

FATS= ★ D25 82329B/45 ★ SU -649-743

Washing powder prodn. components mixer - using electromagnetic field with high speed rotating ferromagnetic particles of specified size to improve homogeneity

FATS RES INST 22.06.76-SU-375157

(28.02.79) C11d-11/02

The prodn. of washing powder is accelerated and the prod. quality is improved by the prepn. of mixt. of component followed by spray drying.

The mixt. is subject to treatment by ferromagnetic particles with diameters of 2.5-4mm and rotated at 2200-2600 rpm. in the electromagnetic field.

The method eliminates the use of additional equipment for homogenisation of the suspension, and increases the bulk weight or powder, as well as improves its washing capacity and solubility. The electromagnetic treatment lasts 1-5 sec., and the dispersion takes place when the mass exhibits maximum viscosity.

Grin, V. T., Mordovin, V. V. Bul. 8/28.2.79. 22.6.76. as 375157 (3pp89)

CPI INDEXES

ALERTING PATENTEE INDEX (II)

Weekly by section and overall, lists all current patents in patentee code order and, within a given patentee, in earliest priority date order. The first line gives patentee code, earliest priority date, patentee name, CPI classes and finally the current patent number. The second line gives the first part of the title, followed by the accession number.

Not in Basic Abstracts Journal

CPI CLASS INDEX (IV)

Weekly only. Headings are all the CPI classes within the section to which an Alerting Bulletin relates, arranged in numerical order. Posted under each class heading is a list, in country then patent number order, of all basic or equivalent documents referenced or cross-referenced under that heading.

In Country Alerting Bulletin only

BASIC NUMBER INDEX (V)

Weekly by section and overall, lists all entries by accession number. Each heading consists of the accession number in bold, followed by the CPI section letters. There then follows a list of all the family members, commencing with the basic and finishing with the current week's patent. For each family member the CPI week of issue is quoted, and a plus sign indicates that a multiple priority has been claimed.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A-M cumulations of from a quarter up to 5 years are available as COM.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose
A+	Polymer Applns.	G	Printing, Coating, Photographic Chemistry
AE	Polymer & General Chemistry	H	Petroleum
B	Pharmaceuticals	J	Chemical Engineering
C	Agricultural Chemistry	K	Nucleonics, Explosives, Protection
D	Food, Disinfectants, Detergents	L	Refractories, Ceramics
E	General Chemistry	M	Metallurgy
E+	General Chemistry Applns.		

Typical Abstract Heading

See CPI/WPI Instruction Manual No. 1A for explanation of the various flagged descriptors.

Copies of Specifications may be ordered from our PATENTS SUPPLY DIVISION.

PATENTS ON MICROFILM

For a number of countries, we film every patent specification in numerical sequence using a flat bed camera at 24:1 reduction ratio. The 200 ft. polyester diazo negative 16mm reels are second generation from a negative silver master. They are despatched weekly by airmail, shortly after the specifications are published.

A list of the available films is shown below, giving number of reels per country per year, annual costs as from 1st January 1980, and the dates from which film is available. Backlog film can be made available at the same annual costs as for the current year.

Please address orders and enquiries to the PATENTS SUPPLY DIVISION.

This sheet may be used as an order form for both current and backlog orders.

PATENTS ON MICROFILM—AVAILABILITY AND PRICES AS FROM JANUARY 1980

PATENTS COPY SERVICE

The Patents Supply Division has been organised to give an extremely rapid turnaround at low prices. The schedule of prices and turnaround times, together with the methods of ordering and payment, is given below.

SCHEDULE OF PRICES AND TURNROUND TIMES AS FROM JANUARY 1980

COUNTRY	DELAY from receipt of order within:	COST inclusive of (airmail) postage	SURCHARGE if applicable	NOTES
BELGIUM EUROPE PCT	1 day	per page £0.11, \$0.29 or Y84	—	Photocopies
FRANCE	2 weeks	per patent £1.55, \$3.60 or Y950	1p, 2c or 8Y per page if more than 20 pages	Printed copies. Delay reduced to 4 days for double the normal cost.
GREAT BRITAIN	2 days	per patent £1.65, \$3.75 or Y1000	—	Printed copies
JAPAN	4 days	per patent £1.10 or \$2.55	—	Photocopies
NETHERLANDS	1 week	per patent £1.50, \$3.45 or Y860	1p, 2c or 8Y per page if more than 20 pages	Printed copies
SOUTH AFRICA	3 weeks	per page £0.27, \$0.60 or Y170	Minimum charge equivalent to 5 pages	Photocopies
UNITED STATES	4 days	per patent £1.45, \$2.75 or Y880	13p, 25c or 80Y per page if more than 15 pages	Photocopies
WEST GERMANY	2 weeks	per patent £1.70, \$4.00 or Y1,040	1p, 2c or 8Y per page if more than 20 pages	Printed copies. Delay reduced to 4 days for double the normal cost.
CANADA SWITZERLAND EAST GERMANY SOVIET UNION	4 days	per page £0.19, \$0.50 or Y120	Minimum charge equivalent to 5 pages	Photocopies
 Copies of specifications can now be supplied for Austria, Brazil, Denmark, Finland, Hungary, Israel, Italy, Norway, Rumania and Sweden. Prices comprise actual costs plus a nominal handling fee. 				

METHOD OF ORDERING

- (i) By books of standard order forms available upon request, or
- (ii) By letter, or
- (iii) By telex, to cut postal delay. French and West German patents ordered by telex are processed as rush orders at double normal cost (see NOTES above) unless normal service requested.

METHOD OF PAYMENT

- (i) On receipt of bi-monthly invoices, or
- (ii) By charges against deposit accounts. Subscribers are encouraged in their own interest to open deposit accounts with us so as to avoid the need for frequent payments.

Please address orders and enquiries to the Patents Supply Division.

D1: FOOD; FERMENTATION

D11: BAKING

DEBA- ★ D11 82626B/46 ★DS 2836-118
 Hot air circulation baking oven - with slots on baking space top compensating door and rear wall heat losses
 DEBAG DEUT BACKOFEN 17.08.78-DT-836118
 (08.11.79) A21b-01/26

A baking oven is equipped with two cross flow blowers circulating hot air from a heater across the oven space with the dough trolley. The top cover which separates the oven space from the hot air producer has slots along the edges above the oven door and above the oven rear wall.

This compensates for the greater flow resistance in these areas and for their greater heat losses. The result is a more uniform heat distribution and a better quality of the baked product.

Specifically the oven space with the dough trolley is surmounted by a hot air producer with a burner and two cross flow blowers. The hot air is circulated down perforated partitions along the side walls between the door and the rear wall. The heat input to the oven space is supplemented by slots along the top of door and rear wall which give direct access to the hot air producer. The slots have a width of 5-30 mm (10-15 mm). 17.8.78 as 836118
 Div in 2857125,2857126(8pp39).

HAFE/ ★ D11 82641B/46 ★DT 2818-001
 Pastry baking tin - with turned up rims and silicone coated silicon layer

HAFELE J 25.04.78-DT-818001
 A82 (A26) (08.11.79) A21b-03/13

A baking tin for pastry is a rectangular plate with turned-up rims on three sides. The tin has no perforations and is coated at least on top and on the insides of the rims with a heat resistant and pastry non-stick layer. The preferred material for the layer is silicon which may also carry a coating of silicone.

This facilitates the baking operations of the pastry and saves the application of fat to the baking tin. 25.4.78 as 818001 (7pp39)

DURA/ ★ D11 82785B/46 ★DT 2910-502
 Dumpling preparation - by enclosing dough with liquid in impermeable foil bags before dough raising treatment
 DURAN V 16.03.79-DT-910502 (03.05.78-OE-003219)
 (08.11.79) A231-01

Dumplings are prepared by enclosing the dough together with a liquid (water, milk, fat) in a not perforated foil which is impermeable to liquid and compatible with food. The dough raising process can be carried out in boiling water, steam or in an oven or grill.

This protects the dumplings through all process stages right up to their consumption. The foil bag protects against loss of substance if the boiling time is exceeded. Power is saved because the dumplings need not merely float but can now fill up the whole water bath. 16.3.79 as 910502 (9pp39)

NATY ★ D11 82918B/46 ★GB 2020-160
 Prod'n. of whole wheat food esp. breakfast cereal - includes a chilling step to reduce tempering period required
 NABISCO INC 03.05.78-US-902448
 (14.11.79) A231-01/16

A whole wheat food prod. is prepd. by (a) cooking a mixt. of water and whole wheat to produce cooked wheat contg. 28-55 wt. % moisture; (b) holding the cooked wheat for 0-12 hrs. under ambient temp. and pressure; (c) chilling the cooked wheat to 1-12 °C, the temp. being selected according to the holding time, i.e. as the holding time is increased from 0 to 12 hrs. the chilling temp. required is raised proportionately from 1-12 °C, (d) shaping the tempered wheat and (e) baking or toasting.
 Chilling enables the tempering step to be carried out in

a much shorter time, so the process requires less storage space, is shorter, simpler and less labour intensive.
 26.4.79 as 014552 (5pp955)

UNIL ★ D11 83626B/46 ★NL 7804-577
 Dutch pastries prodn. - with ageing of dough in package, e.g. during transport, before baking
 UNILEVER NV 28.04.78-NL-004577
 Q31 (30.10.79) A21d-08 B65b-29

Prod'n. of Dutch pastries, is carried out by mixing flour with a warm aq. soln. of sweeteners and opt. stale cake, spices and preservatives to form a base dough, ageing the dough, and then adding baking powder and baking in conventional manner. The improvement comprises packaging the base dough and ageing it in the package.

Ageing can take place during transport to the baker or consumer. The base dough pref. contains lactic, propionic or acetic acid as preservative. Ageing times can range from >3 (pref. >5) days to 6-8 weeks. 28.4.78 as 004577 (5pp367)

VOTE= ★ D11 83826B/46 ★SU -650-596
 Bread baking dough proving unit - with dough admitted from mixing unit and using exit pipes at top using valves to control dough level

VORON TECHNOL INST 05.10.77-SU-532734
 (07.03.79) A21c-13

Device for 'proving' dough, comprising a vertical cylindrical container with a conical bottom, loading pipe connected to the bottom of the container, attachment for removing the dough, and pipes with gate-valves located in the top part of the container.

Quality is improved and dough yield increased by installing a shaft inside the container vertically with mixing blades distributed symmetrically. Each of these blades has a scraper for cleaning the internal surfaces of the container. The pipes at the top with the gate valves are disposed in rising stages.

Gavrilencov, A. M., Avdeev, A. S., Bul. 9/5.3.79.5.10.77. as 532734 (3pp29).

GODB- ★ D11 B/46 ★SW 7803-568
 Cake icing machine with rotating nozzle - through which icing is extruded while cake remains stationary
 GODBITEN KONDITOR 30.03.78-SW-003568
 (29.10.79) A21c-16

The icing is extruded through a rotating nozzle while the cake remains fixed on a flat surface. 30.3.78 as 003568 (-pp1407)

MSCA- ★ D11 83971B/46 ★US 4173-215
 Steam chamber for foods - has steam generating, circulating and condensing chambers
 MSCAN METAL CANADA 28.07.78-US-928906 (05.12.77-US-857683)
 P28 (06.11.79) A21b-01/08 A47j-27/04

Appts. for steaming foods comprises a steam chamber which communicates with a source of liq. and a heater for producing steam from the liq. The steam chamber is connected to a condensing chamber for the escaping steam which sprays liq. on the steam. The steam is allowed to escape from the steam chamber to maintain atmospheric conditions in the chamber. A fan is used to circulate the steam. The liq. and condensed steam is drained from the condensing chamber.

The appts. operates either manually or automatically at atmospheric pressure and therefore need not be specifically constructed to withstand high pressure differentials. It can be used for cooking or heating foods and minimises overcooking of the food. 28.7.78 as 928906 (8pp1044)

UNIC ★ D12 82544B/46 ★BE-876-120
 Conc. aq. smoke flavour compsn. for coating tubular food wrapping
 -contg. solubilising agent to prevent sepn. of flavour cpds.
 UNION CARBIDE CORP 09.05.78-US-904283
 A97 (08.11.79) A22c A23p

The compsn. pref. in soln. form, comprises > 15% of a uni-form mixt. of cpds. giving a smoke colour and flavour, the cpds. partic. comprising constituents derived from a liq. smoke compsn. or from smoke tans. The compsn. also contains sufficient of a water soluble solubilising agent to prevent the smoke flavour cpds. sepg. from the compsn. The compsn. has a pH > 4, esp. 6-8, and it can also contain a salt of a alkaline neutralising agent.

The compsn. is prepd. e.g. by concn. of a liq. smoke flavour soln. partic. by boiling, in the presence of the solubilising agent to remove acid cpds. and raise the pH above 4 and opt. followed by neutralisation to pH 6-8.

The compsns. are used to coat tubular wrappings for foods with ≥ 0.08 mg, esp. > 0.46 mg, per cm^2 of smoke flavour cpds. A particular wrapping is selected from cellulosic fibres, collagen and PVA. The wrappings are esp. used for meat prods. such as sausage, beef roll and ham. The solubilising agents enables a conc. neutral application of the smoke flavour avoiding excess water and deterioration on storage, with better flavouring results. 8.5.79 as 876120 (29pp597)

UNIC ★ D12 82545B/46 ★BE-876-121
 Wrapping for food products esp. sausages - coated with an albumin and a modified smoke flavour liquid
 UNION CARBIDE CORP 09.05.78-US-904284
 A97 (08.11.79) A22c-13 A23I-01/23

The wrapping has at least a part of its surface coated with an albumin and smoke colour and flavour cpds. derived from a modified smoke liquid chosen from a neutralised smoke liquid, a concentrated smoke liquid, a neutralised concentrated smoke liquid and a smoke liquid from smoke tans. The coating is partic. applied to the inner surface of the wrapping which can be cellulosic, partic. fibre reinforced, or made of collagen or polyvinyl alcohol opt. with fibres. A particular food product comprises a meat based sausage having a surface coating comprising ovalbumin and smoke flavour cpds. derived from a modified smoke liquid. The novel albumin/modified smoke liquid compsn. pref. also contains a cellulose ether, esp. carboxymethyl cellulose.

The mixture enables a coating, giving a better smoke flavour and deeper brown colour, which is resistant to rubbing and forming spots. 8.5.79 as 876121 (36pp597)

FARH D12 38646U/28 = DS 2163-764
 Synthetic sausage casing prodn - giving varying wall thickness for black puddings etc

HOECHST AG (KALL) 22.12.71-DT-163764
 A97 (A23 A32) (08.11.79) *DT2163-764 A22c-13
 Mfr. of a plastics straight tube adapted to be shaped into annular form often required for sausage "ring" casings, employs a molecularly oriented thermoplastics extrudate of uneven wall thickness where sites of max. wall thickness face diametrically opposite sites of min. wall thickness; these maxima gradually passing into minima, and again, from min. to max.

A tube is used whose max. wall thickness is 1.3-3 times the min. The tube is biaxially drawn, and subsequently longitudinally post-drawn at non-uniform temp. in such a way that half of the tube of comparatively greater wall thickness is at a high temp. than the thinner wall section. Post-drawing is effected at 80-150°C. 22.12.71 as 163764 (6pp267).

BECK- D12 47957A/27 = DS 2657-833
 Polyurethane casings for boiled sausages - based on linear aliphatic 6 carbon units and smaller amts. of higher poly:ol(s) or diisocyanate(s)
 NATURIN-WERKBECKER 21.12.76-DT-657833
 A97 (A25) (08.11.79) *DT2657-833 A22c-13

Elastic polyurethanes of mol. wt. $> 2,000$ are composed of high mol polyols, diisocyanates and low mol chain extender pref. glycols. The base units, esp. the polyols and diisocyanate units, are mainly built up of linear, aliphatic 6C units. The equiv. ratio of lower molecular chain extender to high molecular polyols is 50-70:1. The equiv. ratio NCO:OH is 0.95-1.00. The chain extenders contain ≤ 50 mol% aliphatic 6C units.

Biaxially oriented films made from the polyurethanes are highly suitable for the prodn. of sausage skins for boiling or frying sausages. Sausages with smoothly adhering skins can be produced. The polyurethanes are cheap to produce and can be readily extruded, and have superior mechanical properties, appearance and handle. 21.12.76 as 657833 (10pp260).

NMHB ★ D12 82625B/46 ★DS 2833-366
 Pig's head clamping fixture - with rotating spring-loaded jaws in fixed and moving arms
 NORDISCHER MASCHINE 29.07.78-DT-833366
 (08.11.79) A22c-17/02

A clamping device with jaws for positioning and holding a pigs head during trimming operations consists of two rotatable clamping elements, located in a fixed and a moving arm. The element on the fixed arm can be shifted outward against the force of a compression spring and can be blocked against rotation during this movement. The moving arm is urged towards closing the jaws by a spring which produces less force than the compression spring, when the power cylinder is not activated.

The facilitates the clamping operations and the re-positioning of the pigs head so that the operator always has both hands free. 29.7.78 as 833366 (5pp39).

SEIB/ ★ D12 82632B/46 ★DT 2756-959
 Dehydrated air-dried meat mfr. - on trolley by multistage pressing and drying operations
 SEIBOLD A 21.12.77-DT-756959
 (08.11.79) A23b-04/04

Dehydrated air-dried meat is prepared by pickling for several days and dehydrating in several stages. Each stage consists of a press operation to push the fluid from the centre outward, and a drying operation where air in slight motion dries its surface a few millimetres deep.

This produces meat of more uniform high quality with a lower nitrite content in a shorter time. 21.12.77 as 756959 (9pp39)

MAGU- ★ D12 82660B/46 ★DT 2818-348
 Meat band saw machine - with thrust strip for carriage convertible to flat extension table
 MAGURIT GUSTAV RITT 26.04.78-DT-818348
 P54 (08.11.79) A22b-05 B23d-53/06

A band saw machine for food, esp. fresh and frozen meat has a carriage with a thrust strip by which the food can be urged against the saw blade up to a stop. The thrust strip can be turned from the vertical to a horizontal position so that it acts as an extension to the sliding carriage.

This is a simple way of providing a flat unobstructed worktable if the user prefers to do without the thrust strip or larger pieces have to be handled. It saves having to exchange the whole carriage. 26.4.78 as 818348 (16pp39)

GLAS/ ★ D12 82678B/46 ★DT 2818-71
 Meat tenderising machine - has two work rolls with radial and axial cutters and two corrugated back-up rolls
 GLASS H 28.04.78-DT-818710
 (08.11.79) A22c-09

A machine to tenderise meat by performing crosscuts in is fitted with two tool rolls, one with radial blades parallel to its axis of rotation and the other with serrated radial disc plates. Each roll is faced by a back-up roll with a corrugated surface. The two tool rolls are revolved in the same direction; the two back-up rolls are also revolved in the same direction, opposite to that of the tool rolls.

This machine can process lumps of meat of any size

shape. It provides a simple quick and reliable way of performing the cruciform incisions. 28.4.78 as 818710 (18pp39)

CHM/ ★ D12 82680B/46 ★DT 2818-722
Carcass rib scraping tool - with steel wire loop pushed by power cylinder

SCHMIDT G 28.04.78-DT-818722
(08.11.79) A22b-03/10 A22c-17

A scraping hand tool to remove the meat adhering to ribs in the thorax of a carcass consists of a power cylinder with a scraping device such as a wire loop at the end of the piston rod. The cylinder is extended at the forward end by two guide rods with teeth for anchoring the end before the piston rod is pushed out.

This saves time and all manual labour in the operations to extract the bare bones from the thorax of an animal carcass. The tool is simple and requires no manual effort. 28.4.78 as 818722 (11pp39)

VISA ★ D12 82912B/46 ★GB 1555-801
Method of forming sausage without separate casing - by contacting surface of sausage paste with protein-precipitating agent to form skin

VISKASE LTD 26.01.76-GB-002835 (18.07.72-GB-033549)
A97 (A14) (14.11.79) A22c-11

A sausage is formed from a paste containing extd. salt-soluble protein. The paste is extruded into a permeable casing whose outer surface is contacted with a protein-precipitating agent which reacts chemically with the protein present at the surface of the paste to form a skin.

The filled casing is washed and the casing subsequently removed. The skin is capable of holding the sausage together after removal of the casing. Residual protein-precipitating agent is removed so that deep penetration of the agent into the produce is prevented. The contacting of the filled casing with the agent occurs in a first channel, the agent conveying the filled casing through this channel.

The method is used to produce sausages without a separate outer casing. 25.1.77 Add to 1422344 (7pp295)

Straw processing and dehydration - in impact rotor with contra-rotating stator and following centrifuge
WIENEKE F 03.05.78-DT-819363 (00.00.78-DT-810944)
C03 P12 P41 (08.11.79) A01d-43/10 A01d-91/04 A23n-17 B02c-13/06 B02c-19/12

A machine for the processing and dehydration of damp material, esp. straw and stalks, consists of a rotor, which carries impact and/or ripping tools, and of a housing enclosing it. The housing which rotates together with the following centrifuge opposite to the rotor also carries impact and/or ripping strips on its inside.

This produces a centrifuging effect on the juice ahead of the centrifuge and raises the centrifuging efficiency without

requiring any extra space. 3.5.78 as 819363 Add to 281094 (6pp 39)

TUCH- ★ D13 82739B/46 ★DT 2819-554
Milk sampler - adds preservative in exact proportion to sample volume
FA TUCHENHAGEN O 05.05.78-DT-819554
P13 R16 (08.11.79) A01j-07 G01n-01 G01n-33/04

A milk sampling device adds a chemical preservative to the sample in exact proportion to the volume of the extracted sample. The sampling operation produces a pressure differential which effects the dosage or the piston for the preservative is mechanically coupled to that of the sampler.

This reduces errors in the rate of preservative admixture to a minimum. 5.5.78 as 819554 (9pp39)

Prepn. of chewing gum base compsns. - from elastomers by two-stage intensive mixing under high shear
WARNER-LAMBERT CO 01.05.78-US-901371
A97 (08.11.79) A23g-03/30

Chewing gum base compsns. are made in two stages, by (A) mixing solid elastomer, solvent and oily plasticiser with high intensity under high shear, the elastomer being first reduced to a molten lump-free mass, the solvent gradually added and then the plasticiser added stepwise with continued mixing, and (B) incorporating hydrophobic plasticiser, oily plasticiser, non-toxic vinyl polymer and emulsifier into the molten mass, with continued high-shear mixing until a uniform compsn. is obtd.

Time required for the usual 3-stage mixing, with only the first stage under high-shear conditions is much reduced, and a single mixer can be used. The process is flexible and can be carried out as a batch or continuous process. 2.5.79 as 917722 (26pp195)

ORIO/ ★ D13 82853B/46 ★FR 2415-966
Thin wall plastic moulds for cast frozen ice foodstuffs - comprising simple hollow shapes which shatter as the crystallising ice expands
ORIO L J R 06.02.78-FR-003925
A88 (05.10.79) A23g-09/22

Moulds for cast frozen goods, e.g. 'water ice' desserts, are made as a monolithic shell with a restricted entrance and provided with integral seams of weakness so that as the frozen contents expand, the shell is shattered to permit its removal.

Used esp. for accepting ice concoctions which expand 7-8% when frozen at approx. -40°C . The moulds may be made by casting, blow-moulding, injection moulding etc. more simply than split moulds which require some form of catch to keep them closed and manipulation in order to release the contents. No specific plastics materials quoted. 6.2.78 as 003925 (6pp515).

Sterilising and packing food prod. into plastic sack - using single autoclave for simultaneous but separate sterilisation of prod. and sack
RAMBAUD M E M 06.02.78-FR-003234
Q31 (05.10.79) A23l-03/16 B65b-55/02

A portion of prod. and a container are sterilised simultaneously but separately in the same sealed autoclave. The prod. is filled into the container which is closed and sealed while still in the autoclave. Filling is pref. carried out under vacuum after sterilisation. The closing and sealing carried out inside the autoclave may be of a temporary nature, a permanent seal being completed after the container has been removed from the autoclave.

Used for sterilising and packing food prod. into large containers, e.g. 5 to 30 kg. capacity. Complete sterilisation is ensured without requiring heavy, expensive containers which are necessary for sterilising after canning. There is no risk of contamination during filling and no need for supplementary sterilising after the container has been sealed. 6.2.78 as 003234 (16pp448).

VINC/★ D13 82855B/46 ★FR 2415-972
 Mixing milk powder with hot water to feed calves etc. - using recycling pump for completely homogeneous mixt.
 VINCENT M 03.02.78-FR-003600
 C03 (05.10.79) A23n-17 B01f-01 B01f-05
 The installation comprises a tank in which milk powder is poured into hot water. A pump, fitted under the tank, recycles the mixt. against the inside of the tank wall and causes the contents of the tank to swirl around fixed mixing blades. At this stage the recycling valve is open and the outlet valve closed. After about six minutes the mixt. can be drained via a flexible pipe to feed individual calves.
 The installation ensures excellent homogeneity of the mixt. and obviates man-handling buckets of the mixt., which leads to spillage and deterioration of the prod.
 8.2.78 as 003600 (4pp448).

Cheese making with addn. of powdered cheese - improved by homogenisation before or after cheese addn.

RUYS JJ 26.04.78-NL-004456
(30.10.79) A23c-19/02

Cheese-making process in which finely divided ripe cheese is added to the milk before adding the rennet is improved by homogenising the milk before or pref. after adding the ripe cheese. Homogenisation increases the cheese yield (e.g. to 7-8 kg. per 100 kg.). The cheese ripens more rapidly than conventional cheese.

The ripe cheese pref. has a particle size of <0.1 mm. and is added in an amt. of 6-50 wt.% based on the solids content of the milk. The ripe cheese is pref. homogenised with part of the milk (>10% of total) and then mixed with the rest of the milk. Homogenisation is pref. effected at 30-40°C., 26.4.78 as 004456 (6pp367)

MILK= ★ D13 83724B/46 ★ SU -649-393
Full cream curd cheese contg. curd and fat emulsion base - with addn. of conc. whey for high organoleptic and biological properties, and for utilisation of all milk components
MILK IND RES INST 10.09.76-SU-407002
(28.02.79) A23c-19/02

Cream cheese contg. a curd and a fat emulsion is improved by the addn. of concentrated whey (60-65% solids), whereby the quality of the cheese is improved, and milk components are more fully utilised. The cheese contains (in wt. %) curd 30-50, fat emulsion 25-40 and conc. whey 20-35.

Cream cheese is usually produced by preparing a fat emulsion based on cream, mixing the emulsion with curd and mechanically working the mixt. This method is modified by introducing conc. whey before the curd; pasteurising the whole mixt. at 90-95°C; cooling to 55-60°C and passing through a colloidal mill.

Preserving biological activity of components of fodder premixes - by introducing antioxidants e.g. dihydro pyridine derivs. with synergistic additives, pref. choline bromide or monoethanol-amine phosphate

FODDER IND RES INST 03.02.75-SU-102824
C03 (28.02.79) A23k-01/14

Biologically active cpds. in fodder premixes can be stabilised by introduction of antioxidants in combination with synergistic additives.

Highly effective synergists are choline bromide and monoethanolamine phosphate. The pref. antioxidants are diludin and santoquine.

Choline bormide is pref. added in an amt. of 0.95-1.6 pts. wt. per 1 pt.wt. of the antioxidant or 1.2-2.0 wt. % w.r.t. the premix. Monoethanolamine phosphate is pref. added in an amt. of 0.8-2.4 pts. wt. per 1 pt.wt. of the antioxidant or 1.0-3.0 wt. % w.r.t. the premix. Apart from the stabilising synergistic effect choline bromide and monoethanolamine phosphate serve as structural components of organs and tissues of animals.

Prepn. of dry potato products - by dividing pulped potatoes into two phases, partly evaporating liquid phase, mixing it with dense phase, and evaporating mixt.

POTATO FOODSTUFFS 05.07.77-SU-503767

(28.02.79) A23I-01/21

Prepn. of a dry potatoe prod. is simplified by dividing pulped potatoes into a liquid phase and a more dense phase. The liquid phase is evaporated until its moisture content reaches the equilibrium state. This phase is mixed with the originally more dense phase(contg. 45-65% moisture) in such a ratio that the mixt. does not contain more than 20-30% moisture. The mixt. is then dried at 110°C to a residual moisture content of 12%.

The liquid phase is the natural potatoe juice. The more dense phase contains insoluble starch and cellular tissue. The potatoes are first comminuted and treated with 0.1% sulphate soln. to prevent fermentation. Then the phases are sepd. by filtration under pressure. Further processing proceeds as described above. By this method the necessity of drying the prod. twice is eliminated. The dry prod. contains more than 80% of starch; the other components include sugar, proteins and cellulosic substances. Suboch, F. I., Bul. 8/28.2.79.5.7.77. as503767(2pp70).

A submersible air mat comprises a set of connected, hollow elements through which air can be blown into a bath of water to produce bubbles. Each element is made up of a pair of half-casings joined on a horizontal plane. The air outlet holes of the element lie on the joint faces of the two half-casings, each hole being bounded by opposing casing faces. Air inlet and distribution passages pref. also split at the joint between the two half-casings.

Air outlet holes can be channeled into both faces at the

joint or into only one face, the being flat. Air outlet hole can be of normal size for prodn. of a bubbling bath or much smaller to produce a sparkling effervescent bath. Different hole sizes can be provided in a single element. Elements with different hole sizes can be mixed in a composite mat. Holes of each size are pref. colour coded.

Cost of mfr. is reduced as air injection holes do not require machining. All holes are easily descaled by splitting element at joint faces. Elements can be made up into mats to fit any size and shape of bath. Individual element can be used for bubble massage. Air outlet holes are not blocked by a bather sitting on the mat. 6.7.79 as 877562 (27pp448)

 Aeration apparatus - which provides mixing and circulation of gas and fluid

STONE JS (SAN-) 07.03.68-US-711453
 (08.11.79) *GB1266-572 +C02c-01/06

In a tank for the treatment of sewage, a wall in the form of a closed ring tapers inwards from close to the bottom, to a plane above the water level, and encloses part of the volume of the tank in a treatment zone. A second closed annular wall is positioned inside the first and runs parallel to it, but has its upper edge below the water level. The gas feeders open into the cavity between the two walls and the sewage inlet opens centrally from above into the treatment zone.

The guided flow sets up a circulation in the tank leading to a uniform oxygen requirement and a correspondingly uniform biological growth resulting in greatly improved operational efficiency. 6.3.69 as 911377 (7pp1045).

 Sludge separation tank - having sludge collection funnel discharge controlled depending on degree of filling

PATERSON CANDY INT 26.09.72-GB-044449
 J01 (08.11.79) *DT2348-175 B01d-21/24

The sludge funnel of a tank for separating solid matter from fluids using a fluid filtration layer, esp. of floating particles with which the solid matter coagulates and forms a sludge, which can be syphoned off via a drain, is arranged so that its upper edge coincides with the level of the filtration layer. The funnel is supported by floats in the liquid collected above the filtration layer, and the drain can be opened and closed dependent upon the vertical position of the funnel in the separating tank.

This results in a higher throughput of fluid and more economic operation. The emptying sequence is extended and the automatic emptying of the sludge funnel works reliably. 25.9.73 as 348175 (6pp1045).

Removing malodorous components from night soil - by adding hypochlorite during night soil dipping operation and passing generate gas through hypochlorite soln.

OIKAWA S 28.03.78-JA-035670

(04.10.79) C02c-01/40 C02c-05/04

An appropriate amt. of hypochlorite is added to night soil during the night soil dipping-up operation and also waste gas generated during the dipping-up operation is passed through a hypochlorite soln. The addn. of the hypochlorite to night soil results in the reaction of the hypochlorite with hydrogen sulphide, ammonia, methane, methyl mercaptan, ammonium acetate, etc., which are the major sources of malodours of the night soil, where whitish solid powders are formed and sepd. from transparent and odourless liquor and thus malodours are completely eliminated.

The method can completely deodorise the night soil in addition to its sterilisation effect and thus contribution to the elimination of the environmental pollution due to the night soil dipping-up operation by vacuum cars, as well as an improvement in operational environment for workers. 28.3.78 as 035670 (2pp117)

 Estimation of pH of mixed water in mixing chamber - includes measuring temp., alkalinity and pH of incoming water before coagulant addn., and obtaining carbon dioxide discharge rate
 HITACHI KK 31.03.78-JA-036612
 (08.10.79) B01d-21/* C02b-01/20

The pH of mixed water in a mixing chamber in a filtration plant is estimated where the temp., alkalinity, and pH of the water coming into the mixing chamber are measured by a thermometer, an alkalinity meter and pH meter at the upstream side of the mixing chamber, prior to the addition of coagulant, e.g., aluminium sulphate, polyaluminium chloride, etc. The pH of the water is measured by a pH meter provided between the mixing chamber and the flocculation basin, and the discharge rate of carbon dioxide generated when coagulant is added to the mixed water, into the atmosphere is obtd. The pH of the mixed water is estimated on the basis of this data and adjusted to 7.0.

The method can estimate exactly the pH of a water mixt. with allowance for the discharge rate of carbon dioxide generated upon addition of coagulant into the atmos. while correcting in succession the CO_2 discharge rate varying with various conditions, e.g., mixing, weather, pH buffering ability, etc., thus assuring stable purificn. of water. 31.3.78 as 036612 (5pp117)

 Treatment of waste water - using water-soluble oxidn. catalyst contg. chromium salt or iron salt, opt. mixed with other metal salts
 DAINIPPON INK CHEM KK (DNII) 31.03.78-JA-036887
 E19 (08.10.79) C02c-01/40 C02c-05/04
 Treatment of waste water, e.g. industrial waste waters

and living waste waters, using a specific water-soluble metal catalyst, is claimed. A water-soluble metal catalyst composed mainly of a water-soluble Cr salt alone, e.g. chromium nitrate, chromium chloride, chromium sulphate, etc., or a water-soluble Fe salt alone, e.g., ferric chloride, ferrous sulphate, ferric sulphate, iron alum, etc., to which is added, as required, other water-soluble metal salts is prepd. The catalyst is added to waste water at a pH at which the water-soluble metal catalyst does not undergo hydrolysis to form insoluble hydroxides, and then the waste water is oxidised using air or O₂ at 150-300°C under a pressure of 10-100 kg/cm² under which waste water can be kept in liq. state.

Method can treat waste water, partic. highly contaminated water contg. polyhydric alcohols, organic acids, phenols, aromatic sulphonates, night soils, etc., with very high efficiency. 31.3.78 as 036887 (3pp117)

SHIA ★ D15 83398B/46 ★ J5 4129-756
Dephosphorisation of waste water contg. organic phosphorus cpds. - by biological treatment under aerobic conditions to form inorganic cpds. and sepn. of solid particles

SHINKO PFAUDLER KK 30.03.78-JA-037301

C01 (08.10.79) C02c-05/10

In the dephosphorisation of waste water contg. large quantities of organic phosphorus cpds., e.g. discharged from mfr. of organic phosphorous agrochemicals, the waste water is first subjected to a biological treatment under aerobic conditions to change most of the organic phosphates into an inorganic phosphorus form (like phosphoric acid) or an easily coagulable form, and then the waste water thus treated is subjected to sedimentation, floatation, filtration and/or adsorption treatments to separate solid particles from the waste water.

Method can convert the organic phosphorous cpds. which are difficult to remove by conventional methods, e.g. using lime, into inorganic type phosphorous cpds. (PO₄-P) which are easily coagulable. 30.3.78 as 037301 (3pp117)

SHIA ★ D15 83399B/46 ★ J5 4129-757
Dephosphorisation of waste water - by adding controlled amt. of lime and agitating strongly and then moderately before sepg. obtd. flocs

SHINKO PFAUDLER KK 31.03.78-JA-037708

C01 (08.10.79) C02c-01/40 C02c-05/02

In the dephosphorisation of waste water contg. large quantities of phosphorus cpds., e.g. those discharged from the mfr. of organic phosphorous agrochemicals, lime is added to the waste water, followed by sedimentation, filtration, etc. The amt. of lime added is limited to approx. the theoretical reaction equivalent to phosphorus in a strong alkaline region, and then strong agitation (enough to destroy coarse flocs formed) is applied immediately after the addition of lime and then moderate agitation is applied to form flocs which are, in turn, pptd. and removed from the treated waste water.

Method can attain higher dephosphorisation efficiency for phosphorus-rich waste water by the addition of smaller amts. of lime in a short time, and thus the amt. of sludge generated is small and the cost of treatment is reduced. 31.3.78 as 037708 (3pp117)

Oil floating on water is collected using a modified yeast obtd. by carboxymethylating, with CMC, an edible yeast such as bread yeast obtd. by culturing *Saccharomyces cerevisial* or *Candida utilis* with molasses.

Carboxymethylation is pref. carried out in an organic medium such as EtOH, C₆H₆, i-PrOH and MeCOMe etc. due to the fact that the product is lowered in its gelation characteristics when it is carried out in an aq. medium.

The carboxymethylated produce is obtd. in powdered form, so spray-drying or pulverisation are not necessary. Cpd. is non-toxic. 30.4.75 as 052397 C02b-9/02, E02b-15/04 (22.10.79) AGENCY OF IND SCI TECH (3pp) (J5 1128150)

Discharged oil treating agent - comprising modified yeast of *Saccharomyces*, *Torula* or *Candida* gp.

AGENCY OF IND SCI TECH 02.05.75-JA-053441
H03 Q42 (D16) (22.10.79) *J51132-653 + C02b-09/02 E02b-15/04

A discharged oil treating agent comprises the modified yeast obtd. by removing a water-soluble material from a yeast and subsequently carboxymethylating the yeast thus treated.

In an example, a raw or dried yeast, e.g. belonging to *Saccharomyces* gp., *Torula* gp., *Candida* gp. etc. is treated with water, a dol. acid or alkali soln. or saline water at a temp. of from ordinary temp. to 150°C for 10 mins. to 5 hrs. under agitation to separate the water-soluble matter. It is then subjected to carboxymethylated by use of monochloroacetic acid in a medium such as H₂O, EtOH, benzene, isopropanol, acetone, etc.

The amt. of the product used is 2.5-5% by wt. based on that of the flowed-out oil. It exhibits excellent coagulating activity on heavy oil. Valuable material such as liponucleic acid, glutacione, cathalase etc. is recovered from an aq. soln. from which the treated yeast is sepd. 2.5.75 as 053441 C02b-9/02, E02b-15/04 (22.10.79) AGENCY OF IND SCI TECH (4pp) (J5 1132653)

Removing oil floating on sea by gelation - using gelling agent prepd. by dissolving (N) acylamino acid ester or amide in organic medium contg. inorganic metal salt

AJINOMOTO KK 01.09.76-JA-104782
E16 H03 + Q42 (E33 E34) (23.10.79) *J53030-476 + C02b-09/02 E02b-15/04

The method comprises dissolving N-acylamino acid amide or N-acylamino acid ester in an organic medium contg. inorganic metal salt to obtain a gelling agent. The agent is sprayed onto floated oil, and water is sprayed at such a velocity that floated oil is not dispersed to minute drops. The inorganic metal salt is LiCl, NaClO₄, MgBr₂, CaCl₂ or Ca(OH)₂. The organic medium is acetone, acetic ester, or alcohol.

In an example, 9l of heavy oil was floated on 900l of sea water, and the gelling agent was sprayed thereonto. Sea water was pumped up, and sprayed thereonto. Floated oil was gelled and gelled oil was removed with a metal wire net of 100 cm mesh. 1.9.76 as 104782 C02b-9/02, E02b-15/04 (23.10.79) AJINOMOTO KK (3pp) (J5 3030476)

Waste water treatment - using acidic coagulants and basic reagent vary pH cyclically

ENTENMANN INC 27.05.77-US-801375 (07.03.74-US-449003)
(06.11.79) C02b-01/20

A continuous process for removal of wastes from effluent contg. large amts. of sugars and starches comprises a) adding an agent to inhibit fermentation; b) continuously passing the effluent into a clarifier, and adding to the flow an acidic primary coagulant to reduce the pH to 2.5-3.5; c) reducing continuous circulation within the clarifier, and continuously adding an alkaline material to raise the pH to 5-12.5; and form flocs by reaction with the primary coagulant which trap wastes; d) adding an acidic secondary coagulant to the liq. as it circulates, lowering the pH to 5-8.5 and forming more flocs; e) separating the flocs and the clarified effluent.

The process is esp. useful in treating effluent from a cake baking plant, and gives more complete wastes removal than known processes.

The fermentation inhibitor is pref. chlorine or a chlorine cpd. The primary coagulant is ferric chloride soln.; the alkali is lime, and the secondary coagulant is Al sulphate. After the secondary coagulant, more of an alkaline agent may be added. Pref. an anionic or cationic polyelectrolyte is also added to the circulating liq. The effluent may also be pretreated with polyelectrolyte before entering the clarifier. Appts. is described for carrying out the process, including a clarifier fitted with inlets for the treatment chemicals, and baffles and perforated plates, which cause circulation of the liq. so that the treatment chemicals are added in the above sequence and which trap flocs. Two or more clarifiers may be used, connected in series, so that the pH cycle described is repeated. Smaller amts. of reagents are required in each successive clarifier stage. If the effluent is pretreated with polyelectrolyte, further stages are not usually required. 27.5.77 as 801375 (+27.2.76-US-662286)(17pp955)

ESSO ★ D15 84036B/46 ★US 4173-533
Removing suspended oil droplets from water - using partially submerged, vertical pipe with injection of gas bubbles to contact oil droplets

EXXON PROD RES 07.11.77-US-848961
H01 (06.11.79) B01d-37/02

Suspended oil droplets are removed from waste water by passing the waste water into a submerged vertical pipe and introducing a gas from a separator above the surface to the lower portion of the pipe. The gas is injected into a diffuser which forms gas bubbles for countercurrent contact with the waste water as they rise in the pipe.

The overall density of the suspended oil droplets is reduced so as to promote gravitational separation of the oil droplets from the waste water. The oil is withdrawn from the top of the pipe and clarified waste water is discharged from the lower portion of the pipe.

Used for offshore operations where oil and water mixts. are produced from an offshore well. The combination of gravitational separation provided by the pipe and flotation separation provided by the injected gas permits a larger vol. of oil bearing waste water to be clarified than that achieved by conventional skim piles. The appts. is practically maintenance-free. 7.11.77 as 848961 (6pp1044)

Thickener unit for primary and secondary sewage sludge - includes upper and lower feed wells, a confined liquid zone and an aerator

ENVIROTECH CORP 12.12.77-US-859768 (30.09.76-US-728480)
(06.11.79) C02b-03

A treatment unit for concomitantly treating primary sludge and aerated sludge in an activated sludge type wastewater treatment system, includes an open tank and a continuous partition wall which defines a confined liq. zone. A float collection box is mounted within the zone to collect solids.

The tank is connected to a primary clarifier.

The bottom of the tank includes a sediment collection region. Primary sludge is introduced into a lower feedwell and flows into the lower part of the tank to thicken. Secondary sludge is aerated and introduced into an upper feedwell so that it flows and thickens in the upper part of the tank by flotation type thickening.

Used for purificn. of municipal or industrial wastewater. Aerated secondary sludge in the upper zone of the tank forms a blanket of oxygen-rich liq. above the primary sludge in the lower zone. The blanket diminishes the tendency of the primary sludge to become anaerobic and promotes aerobic decomposition of solid particles rising into the blanket from the primary sludge. 12.12.77 as 859768 (C.i.p 4082 671) (8pp1044)

Reduction of phenylalanine levels in blood and other media - by use of phenylalanine ammoniac lyase enzyme on porous fibres of biocompatible cellulose triacetate

SNAMPROGETTI SPA 12.05.78-IT-023336

A96 B04 P34 (12.11.79) A61k A61m B01d

Compsn. for reducing the level of phenylalanine in the blood or other medium contains the enzyme phenylalanine ammoniac lyase, fixed on porous fibres of biocompatible cellulose triacetate. The cellulose triacetate is usually made biocompatible by addition of a blood platelet aggregation inhibitor.

The inability to metabolise phenylalanine is usually hereditary and causes phenylketonuria or Folling's disease and causes mental retardation, convulsions, eczema and affects skin pigmentation. High phenylalanine blood levels affect the metabolism of tryptophane, tyrosine and catecholamine formation. It has also been suggested that elimination of phenylalanine reduces leucemia cell formation.

The method of fixing the enzyme on cellulose triacetate fibres avoids the rejection problem and allows the blood levels of phenylalanine to be controlled. The compsn. may also be used to eliminate (or reduce) phenylalanine in foodstuffs before their use and avoids time-consuming chromatographic preparations. 11.5.79 as 876204 (8pp395)

(08.11.79) C12g-01/02

In a fermentation process of mashed red grapes, the husks are kept in uniform distribution in the grape juice by a descending circulatory current which counteracts the buoyancy forces acting on the husks. These are therefore surrounded by fluid on all sides with the greatest possible diffusion.

The result is an intensified contact between husks and juice without damaging the husks, so that the treatment is completed in a shorter time and becomes more economical. 25.4.78 as 818013 (24pp39)

BOEF ★ D16 82716B/46 ★DT 2819
Substrate for serum alpha-amylase determination - contains starch or amylose granules surface crosslinked to control swelling

BOEHRINGER MANNHEIM GMBH 02.05.78-DT-819298

A89 B04 R16 (08.11.79) C08b-31 C08b-33 G01n-31/14

Substrate for the determination of α -amylase based on partially starch derivatised with determinable gps., consisting of surface-crosslinked starch or amylose granules of diameter 0.01-0.20 mm with a controlled reduction in swelling capacity.

Used e.g. in determination of serum α -amylase activity which is an important clinical parameter for pancreatic function. The substrate is uniform, both within a batch and from batch to batch, and gives improved linearity of absorption. This makes the repeated determination and calibration curves unnecessary. 2.5.78 as 819298 (14pp)

 self-cleaning disc filter esp. for wine - having circular filter discs
 attached to shaft which can be rotated with scraped forks pivoted in
 centre and supported to clean off deposits

DELLA TOFFOLA F 04.05.78-IT-082522
 J01 (08.11.79) B01d-33/26

self-cleaning filter device with dry cake discharge has a
 number of circular filter discs mounted on a shaft to which
 they are rigidly attached. Also pivotted on the shaft are
 scraper forks which extend along either side of the disc.
 They have a support at the outer end to prevent them rotat-
 ing with the disc.

There is only a very small clearance between the disc
 and the scrapers so that virtually all deposits are removed
 when the disc is rotated. The shaft has a drive motor att-
 ached to it. Below the discs there is a screw conveyor to
 remove the dislodged dry cake at the bottom of a conical
 hopper.

Used for filtering liquids esp. wine, for which filter aid
 and precoat is used. Allows cleaning without wetting out the
 cake and reduces turnaround time for the cleaning operation.

Excavating process using stabilising liq. - comprising an aq. soln. of xanthan gum, i.e. water-soluble heteropolysaccharide obtd. by modifying carbohydrate with *Xanthomonas* bacteria

TOA GOSSEI CHEM IND LTD 29.03.78-JA-035563
A81 (05.10.79) C09k-07/02
The improvement comprising using, as stabilising liq., a soln. prepd. by dissolving 0.01-0.5 pts. wt. xanthan gum in 100 pts. wt. water, and replacing excavated mud in the innerpart of the hole with concrete to form driven stakes a continuous underground wall so that collapse of the inner wall of the excavated hole is prevented.

The stabilising liq. is not deteriorated by the action of the cement, so that the stabilising liq. can be recirculated and reused. The process can be used for excavation of sea water-contg. soil. 29.3.78 as 035563 (6pp34)

TOAG ★ D16 83160B/46 ★ J5 4128-48
Compsn. for ground-excavating stabilising liquor - comprising xanthan gum obtd. by modifying carbohydrate with *Xanthomonas* bacteria, fine siliceous powder and short fibres

TOA GOSSEI CHEM IND LTD 29.03.78-JA-035564
A81 Q42 (05.10.79) C09k-07/02 E02d-17/04
Compsn. comprises xanthan gum, i.e. water-soluble heteropolysaccharide, obtd. by modifying carbohydrate with bacteria of *Xanthomonas* gp., finely powdered siliceous matter having a granular size of < 10 (pref. < 1) μ , e.g. clays, white carbon and anhydrous or hydrated silica, etc. and/or short fibre having a length of < 2 (pref. < 100) μ , e.g. rock wool, pulp, glass wool, polypropylene fibre, cotton and wool etc. The amts. of the finely powdered siliceous matter and the short fibre are 1-50 (5-30) pts. wt. resp. against 1 pt. wt. of xanthan gum.

Compsn. is used for ground-excavating stabilising liquor which can prevent collapse of excavated ground and prevent worsening of stabilising liquor by the action of cement, further exhibiting more easily discarding treatment of excavated mud than that in prior art where bentonite is used. 29.3.78 as 035564 (6pp34)

KYOW ★ D16 83190B/46 ★ J5 4128-5
Cpd. FU-10, prepd. by cultivating *Micromonospora* strain - is used as intermediate for amino-glycoside antibiotics, e.g. fortimicin and D

KYOWA HAKKO KOGYO KK 24.03.78-JA-033975
B03 (05.10.79) A61k-31/71 C07h-15/22 C12d-09/14
A novel cpd. FU-10 (I) and its non-toxic acid addition salt are new.

(I) is useful as a sy

thetic intermediate for aminoglycoside antibiotics such as fortimicins A and D.

Prodn. of (I) comprises cultivating a FU-10 from the cultured broth. Examples of the microorganisms are

Micromonospora olivoasterospora MK-70 (ATCC 21819) and *Micromonospora olivoasterospora* Mm 744 (ATCC 2009). The cultivation is effected in a culture medium comprising a carbon source, a nitrogen source and an inorganic salt at 25-40°C at a neutral pH for 2-5 days. 29.3.78 as 033975 (7pp33)

TOYOBO KK ★ D16 83226B/46 ★ J5 4128-793
Determn. of alpha-keto:glutaric acid - by treating with hydroxyglutaric acid dehydrogenase and reduced nicotinamide adenine dinucleotide

TOYOBO KK 29.03.78-JA-037047
B04 J04 R16 (05.10.79) G01n-31/14 G01n-33
Determination of α-ketoglutaric acid comprises treating ketoglutaric acid with hydroxyglutaric acid dehydrogenase and reduced type nicotinamide adenine dinucleotide (NADH₂), and measuring the amt. of resulting D-α-hydroxyglutaric acid or that of consumed NADH₂ to determine α-ketoglutaric acid.

α-Ketoglutaric acid coexisting together with various ads. in living body can be enzymatically, precisely and simply determined by using hydroxyglutaric acid dehydrogenase which reacts characteristically with α-ketoglutaric acid.

An example of the enzyme, hydroxyglutaric acid dehydrogenase, is obtd. by culturing *Peptococcus aerogenes* ATCC 14963, which reacts, via. NADH₂ as coenzyme, with α-ketoglutaric acid to reduce it into D-α-hydroxyglutaric acid. The loss of NADH₂ is measured by a decrease in the absorbance at 340 nm. 29.3.78 as 037047 (5pp50)

TOYOBO KK ★ D16 83227B/46 ★ J5 4128-794
Determn. of activity of glutamic oxalacetic trans amylase - by treating sample with L-glutamic acid, oxalacetic acid, hydroxyglutaric acid dehydrogenase and NADH

TOYOBO KK 29.03.78-JA-037048
B04 J04 R16 (05.10.79) G01n-31/22 G01n-33/16
Determn. of the activity of glutamic oxalacetic transamylase (GOT) comprises treating sample with L-glutamic acid, oxaloacetic acid, hydroxyglutaric acid dehydrogenase and reduced type nicotinamide adenine dinucleotide (NADH₂), and determining the activity of GOT by measuring the amt. of resulting D-α-hydroxyglutaric acid or that of consumed NADH₂.

Activity of GOT can be precisely determined by using hydroxyglutaric acid dehydrogenase which exhibits very high substrate specificity to α-ketoglutaric acid and utilises NADH₂ along as coenzyme. By using pyruvic acid in place of oxaloacetic acid, GPT (glutamic pyruvic transamylase) can be also determined in the same way as for GOT; hence the activity of GOT and GPT can be determined by using one kind of enzyme and merely changing part of substrate.

Hydroxyglutaric acid dehydrogenase is obtd. by culturing e.g. *Peptococcus aerogenes* ATCC 14963. The activity of the enzyme, GOT, can be measured using the decreasing rate of the absorbance at 340 nm based on the consumption of NADH₂. 29.3.78 as 037048 (6pp50)

TOYOBO KK ★ D16 83228B/46 ★ J5 4128-795
Determn. of activity of glutamic pyruvic trans-amylase - by treating sample with L-glutamic acid, pyruvic acid, hydroxyglutaric acid dehydrogenase and reduced nicotinamide adenine dinucleotide

TOYOBO KK 29.03.78-JA-037049
B04 J04 R16 (05.10.79) G01n-31/22 G01n-33/16
Determn. of the activity of glutamic pyruvic transamylase (GPT) comprises treating sample with L-glutamic acid, pyruvic acid, hydroxyglutaric acid dehydrogenase and reduced type nicotinamide adenine dinucleotide (NADH₂), and determining the activity of GPT by measuring the amt. of resulting D-α-hydroxyglutaric acid or that of consumed NADH₂.

Activity of GPT can be precisely determined by using hydroxyglutaric acid dehydrogenase which exhibits very high substrate specificity to α-ketoglutaric acid and utilises NADH₂ alone as coenzyme. Also the activity of GOT (glutamic oxalacetic transamylase) can be determined by using oxaloacetic acid in place of pyruvic acid by the method.

An example of the enzyme, hydroxyglutaric acid dehydrogenase, is obtd. by culturing e.g. *Peptococcus aerogenes* ATCC 14963. The amt. of NADH₂ is determined from the fall in absorbance at 340 nm. 29.3.78 as 037049 (6pp50)

Bread yeast prepn. - using medium mfd. by adding nutrients to sugar soln. obtd. by mixing raw sugar and cane sugar

NIPPON TENSAI SEITO KK 31.10.77-JA-129753
(D11) (06.10.79) C12c-11/08
Bread yeast is prepd. using raw sugar as major carbon source, by (a) combining nutrients in a sugar soln. obtd. by mixing raw sugar and cane sugar molasses with the proportion of fermentable sugar 90-70:10-30; (b) combining steffen waste concentrate in amt. corresponding to 2-5 w/w% of fermentable sugar in the mixt.; (c) culturing bread yeast in the culture medium obtd.; and (d) sepg. bread yeast from the cultured medium. Instead of steffen waste concentrate casamino acid, in amt. corresp. to 3-10 w/w% of the fermentable sugar in the mixt. obtd. in (a), may be used.

Waste water is not heavily contaminated in BOD and colour value c.f. when cane molasses are used as major C source. By increasing the osmotic pressure of the culture medium at the stationary phase the sugar resistance of bread yeast obtd. can be improved and the object can be attained by combining sodium chloride 0.5-2.0 w/w% in the culture medium at the stationary phase of the culture. 31.10.77 as 129753 (5pp5)

MITN ★ D16 83361B/46 ★ J5 4129-182
 Bacterial culture of *Microcylus aquaticus* - using methanol as carbon source, gives prod. of high protein content
 MITSUBISHI GAS CHEM IND 27.03.78-JA-035049
 (D13) (06.10.79) A23k-01 C12k-03
 Prepn. of bacterial bodies comprises cultivating a methanol-assimilable bacterium belonging to *Microcylus aquaticus* (e.g. DSM 334, ATCC 27068, ATCC 27069, ATCC 2539 and NCIB 9271) in a medium contg. methanol as main carbon source.

Bacterial body of high protein content can be obtd. at a high yield. Since methanol is water-soluble, cultivation is easy and clean bodies can be obtd. by simple working-up treatments.

A suitable methanol concn. in the medium is ≤ 6 wt. %, partic. ≤ 3 wt. %. The cultivation is aerobically conducted at 20-40 °C, pref. 25-37 °C, and at a pH of 5-9, pref. 6-8. The dissolved oxygen concn. of the medium is pref. controlled at 0.5-20 ppm. In case where an ammonium salt is used as nitrogen source, the pH value of the culture decreases during the cultivation so that an alkali is added for pH maintenance. 27.3.78 as 035049 (3pp140)

 Preservation of fixed urokinase or streptokinase enzyme - by storing in inert gaseous atmos. e.g. nitrogen, helium or argon, or in vacuum

UNITIKA KK 30.03.78-JA-037672

A96 B04 (06.10.79) C07g-07/02 C12d-13/10

Preservation of fixed urokinase or streptokinase comprises storing in a gaseous atmos. (e.g. N₂, He or Ar) or in vacuum. When compared with preservation in water, reduction of activity is extremely minimised. No special facilities or complicated operations are needed.

In an example, a nylon 6 tube (inner dia. 3 mm, outer dia. 5 mm) was sliced to thickness of 2 mm. The pieces were thorough stirred in a 3N-HCl aq. soln. at 30 °C and then washed with water; thoroughly stirred in a methanol soln. contg. 2 wt. % of polyethyleneimine and 2 wt. % dicyclohexylcarbodiimide at room temp. followed by drying. The prod. was thoroughly stirred in an acetone soln. contg. 4 wt. % of a maleic anhydride-methyl vinyl ether copolymer and 0.8 wt. % of anhydrous nitrophthalic acid at room temp. followed by washing with acetone and drying; and in a physiological salt aq. soln. of urokinase (600 unit/ml) at 7 °C for 24 hrs. The thus obtd. fixed urokinase was wiped with filter paper, placed in a glass bottle and stored at 7 °C or 25 °C for 3 months. The % maintenance of activity was 103% at 7 °C and 94% at 25 °C. 30.3.78 as 037672 (3pp140)

KYOW ★ D16 83363B/46 ★ J5 4129-187
 Choline oxidase prodn. - by cultivation of *Brevibacterium album* or *cerinum* microorganisms

KYOWA HAKKO KOGYO KK 29.03.78-JA-035349

B04 (06.10.79) C12d-13/10

Prodn. of choline oxidase comprises incubating choline oxidase producing *Brevibacterium* microorganisms (e.g. *Brevibacterium album* KY-4319 (NRLL B=11,046, ATCC No. 15,111), *Brevibacterium cerinum* KY-4320 (NRRL B=11,047, ATCC No. 15,112), in nutrient culture medium.

Choline oxidase is useful for quantitative analysis of choline.

In an example, a platinum loop of *Brevibacterium album* KY-4319 was inoculated in 10 ml of culture medium (pH = 7.2) of 2 g/kl choline chloride, 0.5 g/dl corn steep liquor, 0.5 g/dl yeast extract, 0.5 g/dl Na glutamate, 0.1 g/dl K₂HPO₄ and 0.05 g/dl MgSO₄·7H₂O and incubation was continued at 30 °C. for 48 hrs. with shaking to form a seed culture. The seed culture was inoculated in 2 l of the culture medium and incubation was further continued at 30 °C for 48 hrs. with shaking. After incubation, all of the incubated culture medium was added to 3 l of the culture medium and incubation was continued at 30 °C for 24 hrs. with shaking at 500 rpm whilst aerating at 1 l/l (culture medium). After incubation, 0.52 U/ml of choline oxidase was formed in the culture medium. 29.3.78 as 035349 (9pp68)

 Hydroxy-glutaric acid dehydrogenase - prepd. by culturing fungi of *Peptococcus* genus

TOYOBO KK 29.03.78-JA-037046

B04 E17 (B05) (06.10.79) C07g-07/02 C12d-13/10

Novel hydroxyglutaric acid dehydrogenase is claimed. catalyses oxidn. of D- α -hydroxyglutaric acid via nicotinamide adenine dinucleotide to give α -ketoglutaric acid and reversely α -ketoglutaric acid is reduced via reduced form of nicotinamide adenine dinucleotide to yield D- α -hydroxyglutaric acid. The enzyme is highly specific to these reactions.

Prodn. of the hydroxyglutaric acid dehydrogenase comprises culturing novel fungi of *Peptococcus* genus in culture medium. Enzyme may be used in determin. of α -ketoglutaric acid and D- α -hydroxyglutaric acid and is useful in various analysis for medical and physiological fields to give high reliance of data. As fungi may be cited, e.g. *Peptococcus aerogenes* ATCC 14963 strain. 29.3.78 as 037046 (11pp69)

 Alcohol-ferricytochrome oxidn.-redn. enzyme prepn. - by culturing suitable microbe, e.g. *acetobacter aceti* IFO 3284

FUJI ZOKI SEIYAKU 31.03.78-JA-037828

B04 J04 (06.10.79) C07g-07/02 C12d-13/10

Method comprises culturing a microbe, which can produce alcohol:ferricytochrome oxidation-reduction enzyme (AF-redoxase), in a culture medium and recovering AF-redoxase from the cultured prod.

The AF-redoxase is a novel enzyme, which does not require NAD or NADP as the electron acceptor, requires oxidation-reduction pigment as the electron acceptor, has optimum pH in acidic range, shows good affinity to alcohol and is not inhibited by formed aldehyde. Further it can be measured in the visible zone and it can be used for the enzymo-assay of alcohols.

The microbe may be *Acetobacter aceti* IFO 3284 or *Gluconobacter suboxydans* IFO 12528. The culture is at 28-32 °C at pH 6-7 for 1-3 days by submerged culture. AF-redoxase is accumulated intracellularly partic. in the part of cell membrane and AF-redoxase can be separated by breaking the bacterial body and centrifuging at 27000 rpm for 90 mins. using a super centrifuge. The sepd. fraction contains most of AF-redoxase and AF-redoxase is solubilised with a surfactant. The solubilised AF-redoxase can be further refined by conventional means. 31.3.78 as 037828 (9pp5)

Mechanical foam breaker - has bladed float with spherical support using pins clear in disc perforations

KOLOSHA S N 23.03.77-SU-468165

(07.03.79) B01d-19/02 C12b-01/18

The effectiveness of foam breaking in microbiological or chemical units is enhanced by generating cavitation in the fluid.

The spherical support has studs set with a clearance in perforations of the disc. The shaft carries a conical float attached to the support, and exhibiting blades, and raised by buoyancy when the fluid fills up the tank.

The rise of the float places the disc on the surface of the fluid, and the speed of shaft causes intensive foam forming with proportional pressure exerted by the blades. The disc is then tilted by an amount depending on the clearance of the studs, and thus ensures the break-up of the foam.

Hops bitter substance extractor - has hollow shaft with conical disc between frusto/conical partitions and tangent to nozzles

KIEV FOOD TECH INST 26.09.77-SU-526936

(05.03.79) B01d-11/04 C12c-09/02

The extraction of bitters from hops is accelerated and the usage of extracts leading to increased colloidal stability of beer is improved by the use of the hollow extractor shaft, fitted in the head and connected to the pulsator.

The ring partitions are in the form of truncated cones with apexes down, and the conical discs of the shaft hold nozzles set parallel to the surface of the cones.

The clearance between the cones is adjustable by moving the hollow shaft, and this determines the duration of treatment for the hops in the extractor. The extract is removed at the bottom, and the nozzles tangent to the shaft ensure intensive stirring of the medium.

Continuous sugar centrifuge - with nozzles in ring main spraying diluting liquor on massecuite flying across gap

HEIN L 29.04.78-DT-819135
P41 (08.11.79) B04b-15/12 C13f-01/10

A continuous sugar centrifuge for massecuite has at the base of the divergent bowl an accelerator with a bell. The massecuite has to cross the gap between the bell and the bowl. A diluting liquor is supplied by a pipe to a ring main with nozzles which direct jets of liquor on the mass-

ecuite as it flies across the gap.

This prevents any premature dissolution of sugar, yet reduces the viscosity in time to ensure a clean separation of sugar crystals and molasses. 29.4.78 as 819135(9pp39)

Fructose from glucose soln -by passage under specific - conditions through microorganism cells contg bound glucose isomerase
STANDARD BRANDS INC 09.11.70-US-088187 (10.06.72-SU-793523)

E13 (D16) (25.02.79) *US3694-314 +C13k-11
Glucose is isomerised into fructose by contacting a 5-80 wt. % aq. glucose soln. (viscosity 0.5-100.0cP) with enzyme glucosoisomerase at 20-80°C and pH =6.9.

The yield of fructose is increased and the formation of side-products is suppressed by passing the glucose soln. through 2-12 layers of microorganisms contg. in their cells stabilised glucosoisomerase. Each layer should have an activity of 3-1000 IGIU per cm^3 . The stability is 50-1200 h. The ratio of the layer height to its width is 0.01 to 2.

The starting glucose-contg. soln. is pref. a hydrolysate obtd. by acidic- fermentative liquefaction of starch, or a two-step fermentative liquefaction of starch. The pH is pref. 6.5-8, esp. 7-8. The concn. is pref. 40-60 wt.

%. The temp. is pref. 60°C. The glucosoisomerase can be bound or stabilised inside the cells, or on their surface, by means of various method, e.g. a thermal treatment. These are two types of microorganisms, which can be employed in this process. Thermally unstable microorganisms, such as *Pseudomonas hydrophila*, are sufficiently active only in the presence of arsenate or fluoride ions. This is not necessary, if thermally stable microorganisms, such as *Streptomyces*, are used. Another advantage of this gp. consists in that the isomerisation reaction can be carried out at elevated temp., and hence, intensified. The process can be conveniently carried out in a known stack filter press.

High polymer emulsification agent - comprising complex salt of cationised cellulose or starch and an anionic or amphoteric active agent

LION FAT & OIL KK 28.03.78-JA-035901

A96 (A11) (04.10.79) B01f-17 C08j-03/20

High polymer emulsification agent, consists mainly of complex salt comprising cationised cellulose contg. 0.5-3 wt. % cationic nitrogen or cationised starch contg. 0.5-5 wt. % cationic nitrogen of 0.5 to 5 wt. %, and 0.05 to 1 mol of anion or amphoteric active agent based on 1 cation equivalent of the cationised cellulose or starch mentioned above.

This high polymer emulsification agent enables the stable dispersion of cosmetics and perfumes even when they contain oily ingredients in amts. of 10-50%.

In an example, complex salt was formed from cationised cellulose and anion or amphoteric active agent of 0.05-1 mol equiv. based on 1 cation equiv. of the cationised cellulose, and was mixed with water to adjust to 70 pts. wt., and was stirred vigorously at 60°C for 5 mins. Aq. emulsification agent was thus obtd. To this complex salt soln. were added 30 pts. wt. of liq. paraffin, and were emulsified at 60°C for 20 mins. at 5000 rpm by homomixer. 28.3.78 as 035901 (70pp96)

SHIS ★ D21 83352B/46 ★ J5 4129-134
Three-liq. type hair bleaching agent - comprising mixt. of (bi)sulphite-organic solvent mixed liq., liq. contg. ferrous salt and aq. hydrogen peroxide soln.

SHISEIDO KK 28.03.78-JA-035694

E37 (06.10.79) A61k-07/13

Bleaching agent comprises a mixt. of (a) a 1st liq. composed of (bi)sulphite and organic solvent; (b) a 2nd liq. contg. ferrous salt; and (c) a 3rd liq. comprising aq. H₂O₂ soln.

Liq. (a) is used to partially break the bisulphide bond of keratin in hair. Liq. (b) causes ferrous ions to be adsorbed on the hair forming a complex salt with melanin pigment. On use of liq. (c) liq. H₂O₂ is contact-decomposed with the ferrous ions in the complex salt and melanin pigment is efficiently decomposed.

Melanin pigment in hair can be safely oxidn.-bleached under moderate conditions of pH 5-8 without forming a nasty odour. 28.3.78 as 035694 (10pp5)

LIOY ★ D21 83353B/46 ★ J5 4129-135
Hair treatment compsn. - contg. cationised polymer, fatty acid salt and oily component

LION FAT & OIL KK 28.03.78-JA-035902

A96 E12 (06.10.79) A61k-07/06

Hair-treating compsn. contains 0.05-5 w/w% cationised polymer, 0.1-5 w/w% 12-18C fatty acid salt and 10-50 w/w% oily component.

As polymer, cationised PVP cationised acrylic resin, cationised cellulose, cationised starch, etc. can be used. The cationised cellulose obtd. by cationising hydroxy-methylcellulose which has a polymerisation degree of glucose units of 100-20,000, addition mol number of ethylene oxide on a glucose unit of 1-3 (1.5-2.5), with nitrogen cpd., can be used and that having quat. nitrogen content of

0.5-3.0%, can pref. be used.

With the hair-treating agent the cpd. salt composed of the cationised polymer and the fatty acid salt is stuck to hair together with the oily component and the coating film which is hardly washed out by washing with shampoo or by rinsing, is formed on the hair. The hair-treating agent gives nutrients and emollient effect to hair. The hair is protected from brushing, combing, etc. 28.3.78 as 035902 (7pp5)

YAMA ★ D21 83354B/46 ★ J5 4129-136

Anti-dental plaque compsn. - comprises a liq., solid or semi-solid composed mainly of water soluble glucomannan

YAMANOUCHI PHARM KK 30.03.78-JA-037212

B04 (06.10.79) A61k-07/16

Anti-dental plaque compsn. is liq., solid or semi-solid substance mainly of water soluble glucomannan (I) which suppresses the formation of the dental plaque which causes decay of teeth and other oral diseases.

(I) is obtd., e.g. by washing refined konjak powder with organic solvent such as alcohol to remove water insol. glocomannan and drying the residue. Pref. pure (I) is used in an amt. of 0.1-5.0 (0.1-1.0)% in oral drugs. 30.3.78 as 037212 (5pp5)

KANE ★ D21 83355B/46 ★ J5 4129-137

Nail enamel compsn. - contains acrylic resin mixt. comprising various acrylate and methacrylate ester(s), as film forming agent

KANEBO KK 28.03.78-JA-036292

A96 (A14) (06.10.79) A61k-07/04

A nail enamel contains an acrylic resin mixt. consisting of (a) a methacrylic acid ester copolymer composed of 35-65 (40-60) w/w% of methylmethacrylate and/or ethylmethacrylate and 65-35 (60-40) w/w% of propylmethacrylate and/or butylmethacrylate and (b) a methacrylic acid esteracrylic acid ester copolymer composed of 50-85 (55-80) w/w% of methylmethacrylate and/or ethylmethacrylate and 50-15 (45-20) w/w% of methylacrylate and/or ethylacrylate, as the film-forming agent.

This acrylic resin mixt. is equal to nitrocellulose as the film-forming agent for nail enamels and the formed film is excellent in glossiness, light resistance, bendability, abrasion resistance, stability, water resisting property and hardness. The acrylic resin is soluble in acetic acid esters, ketones and aromatic hydrocarbons and the amt. of toluene in nail enamel can be decreased. Thus the nail enamel is superior to conventional nail enamels in safety and danger of fire. 28.3.78 as 036292 (7pp5)

ASAE ★ D21 83358B/46 ★ J5 4129-150

Fluid shortening prepn. - using fish hardened oil, lauric acid type oil and fat, glycerine fatty acid mono:ester lecithin

ASAHI DENKA KOGYO 31.03.78-JA-037843

(06.10.79) A21d-02 A21d-13/08 A23l-01/19

Method comprises (1) prepg. a compsn. composed of (a) 97.5-98.9 wt. % of oil and fat consisting of 70-90 pts. of fish hardened oil having rising m.pt. 28-40°C and 10-30 pts. of lauric acid oil and fat, 1-2 wt. % glycerin fatty acid monoester and (c) 0.1-0.5 wt. % lecithin; (2) melting the compsn. in a heated vessel at a temp. where β -form crystal is completely melted; (3) passing the melted compsn. through a rapid-cooling and kneading equipment with stirring to cool it to the temp. where it is $>5^\circ\text{C}$ lower than the rising m.pt. of the fish hardened oil; (4) re-turning the compsn. to the vessel; (5) repeating steps (2) and (3) more than once continuously; (6) cooling the compsn. in the vessel to 40-55°C; (7) then cooling the compsn. with a cooling velocity of $<10^\circ\text{C/hr.}$ to the solid fat indicator 5-12; (8) stirring the compsn. for >2 hrs. at that temp. and (9) preserving it at that temp.

β' -form crystal is dispersed and shortening excellent in creaming properties, crystallising properties and β' -form stability, can be obtd. The shortening is composed of very few fine crystals and relatively large amt. of coarse crystals and the fluid shortening which hardly suffers from sepn. and sedimentation, can be obtd. By changing the preserving temp., shortening having desired hardness can be obtd. 31.3.78 as 037843 (6pp5)

STOM= ★ D21 83734B/46 ★SU-649-431
Dental canal filling paste compsn. - contg. zinc oxide, sodium fluoride, acrylamide copolymer, bentonite, DMSO, water and medicinal cpds.

STOMATOLOGY RES INS 18.05.77-SU-480463
A96 B05 (A14) (28.02.79) A61k-05/*

The paste, useful in therapeutic stomatology for filling dental canals in chronic periodontitis and pulpitis comprises (in wt. %): sodium fluoride 3.5-4.5; dimethyl sulphoxide 4.5-5.5; hexacaine 1.0-2.0; acrylamide copolymer 1.5-2.5; bentonite 5.0-6.0; pentol 3.0-4.0; sorbitan oleate 2.0-3.0; fat 7.5-8.5; water 17.0-19.0 and zinc oxide the rest.

The filling compsn. has antiseptic, anti-inflammatory and healing characteristics. It stimulates the regeneration of bone tissue in periapical region.

Dental tray for applying fluoride gel to teeth - has upper and lower polyethylene foam tray portions approximating dental curve and forming medicament holding troughs, and hinges
SYBRON CORP 30.01.78-US-873269
A96 P34 (06.11.79) A61m-35

Dental tray for applying medicaments such as fluoride gel to both the upper and lower teeth simultaneously includes an upper tray portion and a lower tray portion for the upper and lower dentitions respectively. Each tray portion includes an outer shell of closed cell polyethylene foam having a U shaped base approximating the curve of the dental arch. This outer shell has integrally formed buccal, lingual and rear walls upstanding from the base to form a closed medicament holding trough.

The base is flat from the posterior ends of the U-shape to the bicuspid region, and concave from the bicuspid region to the anterior end; the buccal wall being normal to the base from the anterior to the posterior ends. The lingual wall is normal to the base at the posterior ends and inclined to the base away from the buccal wall at the anterior end. The buccal and lingual walls form a trough which increases in depth from the posterior to the anterior ends. The tray portions are connected by hinge members extending between posterior ends of the tray portions, and a handle extends outwardly from the anterior upper edge of each

buccal wall. A layer of open cell polyurethane hydrophilic foam is bonded to and lines the tray portions inner surfaces.

A low cost readily disposable dental tray is provided. 30.1.78 as 873269 (7pp1405)

Non-toxic topical hair colouring compsns. - contg. copper or zinc cysteine, and finely divided sulphur
CDC RESEARCH INC 09.03.78-US-884964 (09.04.76-US-675485)
E12 (E36) (06.11.79) A61k-07/13

Topical compsn. for colouring grey hair contains (a) 0.2-1.5 wt. % of a colouring agent (I) comprising Cu- or Zn cysteine and (b) 0.5-20 (0.5-10) wt. % of finely divided S (II) in a suitable non-toxic aq. vehicle. Non-toxic compsns. gradually colour grey hair to the desired hue, and may be safely used by unskilled personnel. In addn., compsns. have antidandruff (Cu cpd.) and other beneficial properties (Zn cpd.). 9.3.78 as 884964 (6pp478)

RITP ★ D21 84023B/46 ★US 4173-50
Dental tray comprising laminated polyethylene and polyurethane prep. by heating sheets of the materials until tacky, vacuum bonding the sheets and cutting out the article from the bonded sheets

SYBRON CORP 03.02.78-US-874850
A96 (06.11.79) B29c-17/03

Prodn. of a laminated plastics article, such as a dental tray, having an open cell hydrophilic polyurethane foam formed and heat bonded to a closed cell polyethylene foam is claimed. The dental tray has upper and lower portions which are hinged together and contoured to accommodate the partic. tooth structure of the posterior and anterior teeth, and the geometry of the upper and lower jaws. Superimposed sheets of the two foams are heat softened and then vacuum formed and compressed to form a laminated bonded sheet. The tray is contoured and then cut or blanked from the sheet.

A low-cost readily disposable article. Polyethylene and polyurethane foam sheets 64, 66 are unrolled from rollers 60 and 62, and continuously fed through an oven 68. The polyethylene sheet 64, is carried by the polyurethane 66, and propelled through the oven by a chain-drive mechanism 70. The oven is infra-red heated to about 700°-900°F. The sheet surfaces are flash heated to a point between the melting point of the polyethylene and polyurethane i.e. between 225°F and 240°F. When the sheets 64, 66 leave the oven 68 they are tacky but are not joined as they enter a vacuum forming mould 74. The softened polyethylene is compressed against the polyurethane and takes a thinner set. A clamping ring 76 seals the mould, and air is evacuated through a line 86 to draw the sheets 64, 66 over a raised die 82. The open cell structure of the polyurethane is embedded in the softened closed cell of the polyethylene. The dental tray is cut or blanked from the laminated sheet 75 by a knife 84. The polyurethane foam may be in the polyether form and the heating oven chamber is about 12 ft. long; the sheets travelling through the oven at 40 feet per minute. 3.2.78 as 874850 (10pp1405)

Cyclopentanone derivs. of formula (I) are new. In (I) R is 4-6 (pref. linear) alkyl. Specifically claimed is 2,5,5-trimethyl-2-pentyl cyclopentanone.

(I) are used for the prepn. of perfumes and perfumed prods., and in the aromatisation of foodstuffs, feedstuffs, beverages, pharmaceuticals and tobacco. (I) have a fruity character and also develop sweet fermented or mushroom-like aromatic odour. They are prepd. by conventional alkylating reactions. 3.2.77 as 793287 (3pp964)

Washing and cleaning prod., esp. washing powder - contg. ortho-pyro- and tri:poly-phosphate(s) with fusion phosphate
HOECHST AG 11.05.78-DT-820554
(09.11.79) C11d

The product contains 5-30% of a nonionic, hybrid, amphotenic, cationic and/or anionic surfactant 10-30% of a mixt. of detergence auxiliaries consisting of (a) alkali orthophosphate, pyrophosphate, tripolyphosphate and (b) fusion phosphate in which the ratio (a):(b) is from 30:1 to 1:30, the ortho/pyro phosphate ratio is from 10:1 to 1:10 and the ortho/tripoly phosphate ratio is from 20:1 to 1:20, the remainder being auxiliary prods. and additives. The fusion phosphates are highly condensed linear polyphosphates.

The prod. has a reduced phosphate content with resulting less ham to the environment and the detergent power is not less than previous prods. Also the product has good fluidity and stability to storage. 9.5.79 as 876146 (13pp)

UNIL ★ D25 82563B/46 ★BE-876-210
Prepn. of spray dried soap contg. washing powders - mixing suspension with current contg. part of soap or fatty acid
UNILEVER NV 11.05.78-GB-018975
(D24) (12.11.79) C11d

Process comprises forming a 1st current from an aq. suspension of the washing powder constituents and a 2nd current from at least a part of the constituent soap or the fatty acid precursor of the soap. The two currents are then mixed and spray dried.

Omitting the soap from the mainstream results in a lower viscosity and therefore less water may be used, also the main suspension has as a result less tendency to absorb air enabling a powder of higher apparent specific weight. 11.5.79 as 876210 (11pp597)

BADI ★ D25 82636B/46 ★DT 2817-785
Storage stable iodinated block copolymer for disinfectant detergents - contains THF and ethylene oxide polymer blocks
BASF AG 22.04.78-DT-817785
A97 (A13 D22) (08.11.79) C08g-65/32 C11d-03/48

Iodinated block copolymer (I) contg. 5-25 wt. % iodine is based on a polymer (II) of the formula $R(AB)_z$ (where R is H or a 1-18C aliphatic hydrocarbyl gp. if $z = 1$ and R is a z -valent 2-8C aliphatic hydrocarbyl gp. with O- z ethylene oxide (EO) units if $z \neq 1$; $z = 1-6$; A is a (co)polymer block with 4-100 1,4-butylene oxide (THF) units and 0-25 EO units and B a (co)polymer block with 0-50 THF and 1-100 EO units, the fraction of THF being over 50 mole-% in A and under 50 mole-% in B). In (II), the total molar ratio of THF/EO units is 0.25-1.2:1. (I) is produced by combining (II) with sufficient I_2 to give the required bound iodine content.

(I) is used as active component in disinfectant detergents. These are useful, e.g. in the beverage industry and in dairies. (I) has excellent storage stability, even in highly diluted form. 22.4.78 as 817785 (10pp016)

ALCN ★ D25 82734B/46 ★DT 2819-501
Aluminium bottleneck foil or label - secured to container by lye-resistant film contg. detergent or surfactant

Labelling container e.g. with decorative aluminium bottleneck foil - by introducing detergent between foil or label and container
ALCAN FOLIEN GMBH 03.05.78-DT-819510
G03 Q31 (08.11.79) B65c-03/08

One or more substances, (I) which generate or promote a washing activity in the presence of water, is/are introduced between foil or label and container, in a process for labelling containers by bonding bottleneck foils of opt. printed or embossed Al provided with a lye-resistant coating.

Process is used for labelling industrial and domestic glasses and for applying decorative foils on beer- or champagne or other sparkling wine bottles. The labels and foils are applied safely and removed quickly before container re-use. 3.5.78 as 819510 (15pp200)

PERA- ★ D25 82872B/46 ★FR 2416-209
Sulphonation column producing surfactants for cosmetics and detergents - has internal fins to improve contacting and heat dissipation
IIT SAS DI PERANI & 27.10.77-IT-029052
E21 J04 (05.10.79) C07b-13/02

Process and a reactor chamber, pref. column, for the continuous sulphonation of organic liqs. with SO_3 . The gas and liq. flow together as descending currents through an externally refrigerated reaction chamber. The currents flow down the inside of the chamber wall which is now roughened with tiny fins projecting into the liq. The fins can be continuous or discontinuous and arranged in a predetermined pattern.

The height of the fins is pref. between 0.1-10 (0.5-3) mm. Spacing between adjacent fins is pref. 8-30 times the height of a fin. In a cylindrical column, the spacing between adjacent fins is pref. equal also to 0.8-0.1 times the dia. of the column.

Used for prodn. of surfactants partic. for the mfr. of cosmetics and detergents. The fins produce improved contacting and heat dissipation. As a result it is possible to obtain a higher yield of prod., with optimum colour and solubility, than was possible with previous thin film columns. 25.10.78 as 030998 (10pp448).

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose

D1: FOOD; FERMENTATION

D11: BAKING

WINK D11 89000V/52 = DS 2328-250
Front-loading back-discharging multi-zone baking oven - hot gas heating by radiator layout ensuring uniformity of temperature
WINKLER FA KG 02.06.73-DT-328250
(15.11.79) *DT2328-250 A21b-01/26

A conveyor baking oven has an endless apron plate or wire mesh conveyor in each deck. Each deck is heated by hot gas which is circulated through radiators along the top and bottom of each deck. The radiators are subdivided at right angles to the longitudinal axis of the oven and are connected alternately to the left or to the right vertical shaft for the circulation of the hot gases.

The direction of motion of the hot gases in two adjoining radiator chambers is thus opposite. The short flow paths result in small temp. differences between inflow and outflow and in very uniform quality and browning of the prods., even when the baking time is long. 2.6.73 as 328250. (4pp39)

GENM D11 ✓ 97977X/52 = GB 1556-034
Breeding material compsn. and prepn. - by subjecting a mixt. of flour, yeast and whey, as essential ingredients, to raised temps. in an elongated zone

GENERAL MILLS INC 16.10.75-US-623129
(21.11.79) *US3997-673 + A231-01/17 A23p-01
Bread crumbs are prepd. by subjecting a flour and flavouring agent mixt. to a gaseous fluid pressure of at least 15 psi at a temp. $\geq$ 250 °F to fuse the mixt., and propelling the mixt. while still under pressure and heat through an elongate zone to sub-divide the mixt.

Pref. either wheat or rice flour is used in amts. of 85 to 97 wt. % of the mixt. From 0.5 to 2% yeast is pref. present in the mixt. Other ingredients pref. include NaCl, dehydrated whey, monosodium glutamate and vegetable protein. 18.10.76 as 043106 (10pp1376)

EISA ★ D11 ✓ 85338B/47 ★ J7 9023-977
Prepn. of puddings - by placing aq. xylose soln. opt. contg. sugar in a vessel, adding conventional pudding material and heating
EISAI KK 25.02.72-JA-018965
(17.08.79) A231-01/18

Aqueous xylose solution or a mixed solution of xylose and sugar is placed in a vessel for pudding and then pudding material is poured into the vessel, followed by heating. Pudding materials include conventional starting materials for preparation of pudding. 25.2.72 as 018965 A231-1/187 (17.8.79) EISAI KK (2pp22) (J48087060)

KFOO = ★ D11 85651B/47 ★ SU -651-769
Baking tray greaser - has bath filled with oil and rocking plate with wick and scoop to transfer oil from bath to tray surfaces
KAZA FOOD IND DES 30.04.75-SU-130699
(18.03.79) A21b-03/16

Device for greasing trays, in the baking and confectionery sections of the food industry, comprises a bath for the greasing material, mounted so that it can move and into which a working unit, to which a wick is connected, is partially immersed. The uniformity with which the surfaces of the trays are greased is increased and amount of material used is reduced, by making the working unit as a curved plate which is able to rock about and to which a scoop is fastened. The wick is arranged so that the whole surface is disposed above the level of the greasing material, while the scoop is installed so that the wick is pressed against the working unit.

Parmuzin, M.I., Pastukhov, V.M. Bul. 10/15.3.79.
30.4.75. as 130699 (4pp29)

AMCA D11 07767B/04 = US 4173-823
Electrically heated food transporting carton - with resistance coating on corrugated paper board substrate contacted by removable plug used esp. for pizzas

AMERICAN CAN CO 18.07.77-US-816444 (23.06.78-US-918690)
Q77 + R41 (13.11.79) *US4134-004 + H01c-07
An electrical resistance heater is mfd. by laying a strip of electrically conductive material on a sheet of electrically resistive material in such a pattern that the strip has spaced, parallel parts and interconnecting parts; and converting the parallel strips into electrodes for the resistive material and the interconnecting strips into terminals by severing the interconnecting part and the resistive material underlying it, and severing the resistive material along a region adjacent the interconnecting strip and to the side of it between the parallel strips.

The heater is used for a carton for packaging a pizza. It is cheap, dispensable and can be energised through the cigarette lighter terminal of an automotive electrical circuit. The parent patent claimed the food carton. 23.6.78 as 918690 Div. ex 4134004 (4pp976).

BAST - ★ D11 ✓ 85756B/47 ★ US 4173-942
Automatic pizza making machine - uses wobble action of support plate at top of rotating shaft to distribute sauce
BASTIAN BLESSING 09.02.78-US-876271
P42 (13.11.79) B05c-05 B05c-13/02

Machine applies a coating of sauce onto a pizza which rests on a support plate beneath a dispensing nozzle fed by a peristaltic pump delivering a metered quantity of the sauce. The support plate rests on a rotating plate which induces a wobble in the pizza plate although this is prevented from rotating.

A vertical rotating shaft has a radial arm with a horizontal pivot which engages the rotating plate and thus rotates it. A spring urges the rotating plate to a horizontal position but the weight of the sauce compresses the spring so that the rotating plate is no longer horizontal. When this plate rotates it tilts the pizza plate to induce a wobble.

The sauce is distributed over the surface of the pizza as a uniform layer. 9.2.78 as 876271 (7pp295).

WESS / ★ D11 85888B/47 ★ US 4174-408
Dry powder mix for batter - contg. flour, dried buttermilk, dried cream and dried eggs
WESSELSKI FA 12.09.77-US-832652
(13.11.79) A21d-10/04

A dry mix for batter contains 87-95 wt. % farinaceous ingredient(s), 3-7 wt. % dried buttermilk, 1-4 wt. % dried cream and 1-3 wt. % dehydrated eggs.

The mixt. can be stored indefinitely, and is mixed with liquid before use. It forms an adherent, sealing coating which on deep frying forms a crisp golden crust. It may be frozen onto frozen food and remain intact.

The farinaceous material is esp. wheat flour. Salt and pepper and spices, seasonings and colouring etc. may be added. 12.9.77 as 832652 (4pp955).

D12: MEAT; FISH PROCESSING

BORD D12 12699R/08 #DS 1942-905
Packaging film consisting of a plasticised vinyl chloride - (co) polymer containing an antimisting and ant adhesive
BORDEN INC 22.08.69-BE-737870 (22.08.69-DT-942905)
A15 (15.11.79) *BE-737-870 +C08j-05/18 C08k-05/10 C08l-27/06 C08l-31/04

Polyvinyl chloride and/or acetate film is stabilised against mould and adhesion. The additives comprise (a) plasticiser, (20-60 pts.wt. to 100 pts.wt. polymer or copolymer); (b) a partial ester of a 2-6C water-soluble polyol and a 12-18C alkanolic acid and/or adducts of these partial esters, (1 mole), with 2-3C alkene oxides (3-30 moles); and (c) adducts of an alkylphenol, (1 mole), with 2-4C alkene oxides, (3-50 moles), such that (b)+(c) contribute ≥ 4 pts.wt. per 40 pts.wt. (or more) of plasticiser.

The prods. are used in the packing industries, esp. for foods. 22.8.69 as 942905. (5pp047)

PROC ★ D12 84541B/47 ★EP ---5-290
Liq. crystalline food additive emulsion - contains specific emulsifier, water and additive, esp. flavour precursor for meat analogues
PROCTER & GAMBLE CO 28.04.78-US-900956
A97 E19 (14.11.79) A23l-01/34
D/S: E(BE,DT,FR,GB,IT,NL,SW).

Food additive compsn. comprises (a) ≥ 1 emulsifier (I); (b) water at (I): water ratio 1:10 - 10:1 (1:8-8:1) and (c) food additive, i.e. ≥ 1 flavouring agent, colouring or lipid. The compsn. is in a liq. crystalline state which is stable from 98-200°F. (I) is a polyglycerol fatty acid monoester; dicarboxylic acid monoacyl glycerol ester; a sucrose fatty acid monoester or phospholipid.

In (I) the fatty acid is pref. 14-18C, or (I) is lecithin. The flavour is esp. a flavour precursor, and if a lipid is used this is pref. a natural triglyceride used together with an additional non-polar oil-soluble emulsifier (II).

The additive is used esp. in meat analogues contg. texturized protein, lipid and binder. The emulsion has low calorie content, is stable during cooking and is esp. useful for delivering flavour precursors which react at the water-oil interface during cooking to develop the flavour. The compsn. may be incorporated into a food or beverage or laminated onto the outside of the prod.

17.4.79 as 200191 (22pp1251).

(G) ISR:GB1120447;LU--52481; FR1600330; FR1170141; FR1537452;US3752770;US3982881.

LUCH- ★ D12 84594B/47 ★EP ---5-398
Working platform facilitating cutting animal carcasses - for butcher's meat by moving up and down around carcass suspended from conveyor runway

LUCHAIRE SA 27.04.78-FR-012509

(14.11.79) A22b-05/20

D/S: E(BE, CH, DT, FR, GB, IT, NL, SW).

Working platform for manipulating and cutting an animal carcass comprises a moving platform and operator's tool(s). An adjacent overhead runway conveys suspended carcasses to be processed.

The platform can be raised and lowered on a vertical axis inside a supporting structure in which the carcass can be suspended. The carcass can hang through a hole in the platform so that the platform can move up and down around the carcass.

The supporting structure pref. sits astride the conveyor runway. The platform is pref. surrounded by a safety rail with gap(s) through which the suspended carcass can pass.

Used for cutting up slaughtered animal carcasses for butchers meat, e.g. skinning and trimming, cleaning breast bone and chump ends, evisceration and removal of offal.

A single operator can process a complete carcass. Man-handling is reduced and power tools can be arranged readily to hand.

26.4.79 as 400271 (17pp448)
(F) ISR: ---

MIT ★ D12 85395B/47 ★J7 9034-821
Preventing discolouration of meat - by keeping in sealed vessel with oxygen-absorbing agent and removing from vessel in moisture-contg. atmos.

MITSUBISHI CORP 05.03.75-JA-026842

E34 (E14 E17) (29.10.79) A23l-01/27

Method comprises placing meat in a sealed vessel together with an oxygen-absorbing agent (I), and taking out the meat into oxygen-contg. atmos. in the presence of moisture. (I) is e.g. oxalic acid, pyrogallol or Na sulphite, dithionite or hydrogen sulphite. 5.3.75 as 026842 A23l-1/27; 1/31 (29.10.79) MITSUBISHI CORP. (4pp83) (J51104061)

MIT ★ D12 85396B/47 ★J7 9034-822
Preservation of cooked meat - by drying and placing in sealed container with oxygen-absorbing agent

MITSUBISHI CORP 26.06.75-JA-079839

E34 (29.10.79) A23b-04

Method comprises drying (by heating) boiled or steamed meat and, placing the hot meat in a sealed container together with an oxygen absorbing agent (I). (I) is e.g. sodium sulphite, sodium hydrogen sulphite, sodium thiosulphate, sodium dithionite or sodium pyrosulphite. 26.6.75 as 079839 A23b-4/00 (29.10.79) MITSUBISHI CORP. (3pp83) (J52003856)

VOLK- D12 11035W/07 =SU -651-772
Automatic fish filleting machine - completing cut of fishbones from flesh to spine by cutting edges of guide plates

VEB VOLKSWERFT STRA (SCHM/) 28.02.74-DL-176855

(18.03.79) *DL-109-798 A22c-25/16

An automatic fish filleting machine first cuts the body open, spreads out the two sides and cuts the fishbones clear from the flesh up to the spine in two stations. Two spine cutters sever the spine from the flesh and two guide plates direct the fish to two vertical cutters which perform the final cut into two fillets. This machine can be used for all sizes of fish and produces a minimum of waste.

Schmidt, U. Bul. 10/15.3.79. 29.1.75. as 104273 (4pp)

UNIC ★ D12 85865B/47 ★US 4174-368
Curved sausage casing prodn. - by plasticiser treatment, inflation, deformation and neutralisation of plasticiser

UNION CARBIDE CORP 31.07.78-US-929341

A97 (13.11.79) B29d-07/22

Curved regenerated cellulose casings are prepd. by (a) contacting the casing with a swelling agent in sufficient concn. and for a time sufficient to plasticise it, (b) inflating the casing with an inert fluid; (c) passing the inflated plasticised casing around and in contact with a cylindrical surface; (d) contacting the casing with a neutralising agent while it is in contact with the cylindrical surface; (e) removing the casing from the surface; and (f) washing, plasticising and drying the casing.

The casings are used to make annular sausages. The process is efficient and economically attractive.

The cellulose swelling soln. is pref. a 15-25% soln. of LiOH, NaOH or KOH, or a soln. of K thiocyanate, or may be liquid ammonia. The neutralising agent is e.g. H₂SO₄, HCl, citric or acetic acids. The inert fluid is pref. air. 31.7.78 as 929341 (5pp955).

BECK- D12 46971Y/27 =US 4174-436
Polyurethane films for sausage casings - contain a high proportion of 6C linear aliphatic gps.

NATURIN-W BECKER 31.12.75-DT-559318

A97 +P73 (A25) (13.11.79) *BE-850-017 A22c-13 B32b-27/40 C08g-18 42

Polyurethane elastomer which exhibits thermoplastic properties on processing, consists of base units derived from the reaction of ≥ 1 high mol. wt. diol, ≥ 1 diisocyanate and ≥ 1 low mol. wt. glycol as a chain extender. Both the base units are derived from both the high mol. wt. diol and the diisocyanate contg. linear 6C-aliphatic units. The equiv.

ratio of diol to diisocyanate units is 1:3.5-70, and the quantity-wt. ratio is 1:0.4-4.0. The equiv. ratio of glycol to diol is 5-70:1. The chain extender comprises ≤ 50 mol. % of linear 6C-aliphatic units.

The elastomer prep. is esp. used for making mono- and multi-layer food casings, esp. sausage casings, by extrusion. The casings can be boiled and scalded without folding or wrinkling when cooled. 20.7.78 as 926541 Div. ex 4123589 (+23.12.76 - US - 753694) (7pp931).

Cooking fat giving good browning - contains lecithin, galactose and aspartic acid and/or glutamic acid

ZUID NED MELKIND 19.05.78-NL-005463
(19.11.79) A23d

The fat contains lecithin or a lecithin-contg. substance together with galactose and aspartic acid and/or glutamic acid. The galactose may be added in the form of an at least partially hydrolysed protein powder from which the salts and protein are opt. removed. Galactose and amino-acid may be added together in the form of butter milk powder in which the sugar and protein are at least partially hydrolysed.

The fats give excellent browning when used for frying and baking. The combination of galactose and aspartic acid is pref., since although the combination of galactose and glutamic acid gives better browning, there is a risk of too intensive browning taking place, which borders on blackening. 18.5.79 as 876343 (7pp513) (F1)

STOP- ★ D13 ✓ 84211B/47 ★BE-877-807
Stable anti-haemorrhagic vitamin/k adducts with other vitamin cpds. - used pharmaceutically and in foods and feedstuffs

STOPPANIL SPA 21.07.78-IT-026008
B05 C03 (16.11.79) A23k A61k C07a

Novel stabilised adducts (I) of vitamin K type cpds. (II) are prep. by reacting (II) with a compatible cpd. (III) having vitamin activity. (III) contain a quaternisable N atom in a moiety of formula $-N=C$ (where the N atom forms part of a 5-6 membered monocyclic heterocycle contg. 1 or 2 N atoms or of two condensed 5-6 membered rings (aromatic or heterocyclic) contg. one or more N, S or O atoms) or $N-C(R_1)-C(R_2)-C(R_3)-C(R_4)-$ (where the C atoms form part of an aliphatic or aromatic structure, R_1-4 are each H, aliphatic or aromatic gps. of functional gps).

(II) is pref. menadione sodium bisulphite (IIa). (III) is pref. a pyridine, purine or thiazole deriv. an aminobenzoic acid, an aromatic or aliphatic amine or an amino acid.

(II) have antihaemorrhagic activity and are used as food and feed additives (esp. for poultry) and in human therapy. (I) are a stabilised form of (II) which has a high active material content, increased activity and additional activities due to the other vitamins. 20.7.79 as 877807 (15pp941)

Continuous fatty emulsion prodn. - by stirring oil and stabiliser with water and mixing with oil and seasoning
TOSENO-BETRIEB GR D 11.05.78-DT-820579
(15.11.79) A23I-01/24

Semi-solid fatty elumnsions (50% mayonnaise) is produced by mixing emulsifier, thickener, stabiliser and oil and by stirring in a metered amt. of water. After a stay in a swell battery the mixt. receives further oil and seasoning additives in a main mixer and is finally processed in an emulsifier.

This creates a compact low-cost plant which produces 50% mayonnaise continuously and is suitable even for medium and small establishments. 11.5.78 as 820579 (9pp39)

URBA/ ★ D13 84321B/47 ★DT 2820-719
Food seasoning and mixing drum - without inside mixing mechanism, and adjustable for operation in vertical plane
URBASCH G 12.05.78-DT-820719
P28 (15.11.79) A23I-01 A47j-43/04

A drum to apply seasoning to chicken and other meat before frying or grilling or to mix dough is rotatable. The inside of the drum has no mixing mechanism. A horizontal trunnion bearing allows the drum to be swivelled from the horizontal to a 45° up to 45° down position.

This saves the manual labour for seasoning which has to be massaged into the meat and requires much skilled manpower in large restaurants. 12.5.78 as 820719 (12pp)

FRAL/ ★ D13 84364B/47 ★DT 2821-139
Alcohol-contg. fruits prep. from fruits contg. sugar - by diffusing of sterilised fruits with fermented juice enriched in alcohol

FRALING R 13.05.78-DT-821139

(D16) (15.11.79) A23b-07

Fruits are brought in contact with fruit juices enriched in

alcohol for an interaction in which the sugar and aromatic materials of the fruits are exchanged for the alcohol contained in the enriched fruit juices. The fruit juice which then has a very low alcohol content is transferred to a fermentation vessel, in which, after the addn. of sugar, it is fermented into a fruit juice rich in alcohol. After filtration this is returned to an interaction vessel which is filled with fresh fruit, after the processed fruit has been removed and transferred for consumption, preserving, etc.

Method procudes alcohol fruits by using the sugar contained in the fruits without the expense of adding quantities of alcohol to them. 13.5.78 as 821139(13pp1045)

Choosing microorganisms for joint cultivation in ferment prodn. - by determining their souring power proteolytic activity and nucleotide-synthesising activity, used in cheese mfr.
EAST SIBE TECH INST 05.05.77-SU-483645
(D16) (06.04.79) C12k-03

Choice of different microorganisms for joint cultivation to produce souring preparations used in mfr. of cheeses is based on determ. of their proteolytic activity, acidifying power and symbiotic relationship to other microorganisms. This method is improved by additionally determining the nucleotide-synthesising ability (by measuring the light absorption at $\lambda = 257-262 \text{ m}\mu$) of the acid-soluble fraction sepd. from the curd formed by the cultivation of the microorganisms on sterilised skimmed milk for 12-16 hrs. High nucleotide-synthesising ability indicates good symbiotic relationship. By this method, the biochemical activity of the mixed microorganism preparations, in particular the acid formation and the proteolytic activity, is increased. The maturing of the cheeses is accelerated.

Fat-contg. ingredient for poultry feed - is prepd. by mixing melted fat with flour and water, rubbing the mass on friction rollers and drying

AS GEOR PHYS-ORG CH 25.01.77-SU-446232
C03 (07.03.79) A23k-01/16

Fat-contg. component of feed for poultry is prepd. by mixing a floury substance with a molten fat and water to a doughy consistency, and mechanically working the dough to increase its porosity. This is effected by rubbing the dough on frictional rollers at $85-100^\circ\text{C}$ to dryness. Then the dough is comminuted, and more molten fat is admixed at $40-70^\circ\text{C}$. The final drying is performed at $60-90^\circ\text{C}$ for 4-6 hrs. By this method the calorific value of the product is increased and its flowability is improved.

Melikadze, L. D., Mandzhgaladze, I. T., Kvashali, N. F. et al. Bul. 9/5.3.79. 25.1.77. as 446232 (2pp70)

P28 (15.11.79) A23b-07 A23l-01 A23n-13 A47j-43/24

A fixed container having first and second means of draining away water, and enclosing a second container which rotates on a fixed shaft forms an aggregate for washing and drying foodstuffs, esp. fruit and vegetables. The cylindrical surface of the inner container is perforated all over and the inner container can be connected to a source of pressurised water. Spray nozzles are fitted by which a flow of water can be introduced into the inner container so as to set up a swirling and turbulent motion.

The first means of drainage is arranged to maintain a constant water level in the first container, whilst the second means of draining regulates the exchange of water during the washing processes, and waste the water when washing is finished.

Provides a device by which both the washing and the drying processes can be carried out. The design makes it possible, with slight alterations, to cater either for domestic or commercial requirements. In the case of the domestic machine a thorough and efficient washing is achieved in a relatively short time. 4.5.79 as 917960(20pp)

Filtration agent for treating cloudy water and suspensions - which is mixture of porous organic cpds., esp. peat or compost
GEBRUEDER WEISS KG 17.07.78-DT-831384
(16.11.79) B01d C02c

The agent used partic. for municipal, industrial and other sludges, and which is subsequently dehydrated, comprises a mixt. of porous organic substances of high liq. absorption capacity and the particles of which are much larger than the sludge particles. A process for dehydrating

water as above comprises depositing on the screening band of an endless screen press, a 2-10 cm thick uniform layer of the agent which is then sprayed with the water in an amt. 5-10 times the amt. of the layer. The layer is then dehydrated under pressure, the agent being used in the manner of a sponge.

The process is esp. suitable for sludges which are difficult or impossible to flocculate. The water after recovery is of reduced viscosity and there is no redissolution of the suspended particles. 16.7.79 as 877725(8pp597)

BAEC- ★ D15 84206B/47 ★ BE-877-792
Treatment of mixed cow manure - by addn. of coagulating and flocculating agents, sepn. of solids and aerobic stabilisation of the liquor to give effluent of low BOD
BAECK ENGG NV 11.01.79-NL-000224
P11 (16.11.79) A01c
BE 862862 describes a process for treating mixed manure with a high liq. content in which the manure is first mixed with a coagulation agent and a flocculating agent and allowed to react. The mixt. is then decanted to give a solid phase and a liq. phase consisting mainly of water with a B.O.D. of ≤ 4000 mg/l.

The process is now modified for the treatment of mixed cow manure, whereby the liquor is subjected to aerobic stabilisation e.g. by aeration for 4-7 days, to give effluent water with a B.O.D. of ≤ 500 mg/l.

During the aerobic stabilisation, aerobic microorganisms develop which assimilate a large part of the organic material in the effluent water and convert it into single celled material, and this gives effluent liquor with a reduced B.O.D. 19.7.79 as 877792 Add to 862862(7pp513) (F1)

Eliminating iron, manganese, etc from water supply - filter bed in vessel treated in part with oxygenated water
VYRMETODER AB (SUPO-) 27.02.74-DT-409423
(15.11.79) *DT2409-423 C02b-01/26

Iron is removed from water by pptn. with the help of oxygen. The water to be treated is passed through a container contg. a filter material, e.g. sand. From time to time the waterflow is stopped and water contg. oxygen is passed through approx. half of the container.

The process is simple and not costly. 27.2.74 as 409423. (4pp068)

STEAG- ★ D15 84237B/47 ★ DS 2832-274
Aerator for water returned from turbine condenser - has adjustable venturi constriction formed by unequal-sided perforated pyramids
STEAG AG 22.07.78-DT-832274
(15.11.79) C02c-01/02 C02c-05/10

For the enriching of stretches of water with oxygen, esp. water used for cooling power station turbines, the effluents being returned to source are treated by means of an aerating device which incorporates a constriction of the cross-section in the inlet of the return pipe.

At the narrowest point of the constriction there are a number of drilled holes, so that in consequence of the underpressure created, air is sucked in from feed pipes connected to the holes, into the flow of water.

A pipe section having the constriction is threaded into the effluent line, and whilst being movable, it makes a seal with the inner surface of the return line. In front of and enclosing the pipe section, there is an open feed for the water returning from the condenser which flows over aerating elements projecting from the inner surface of the pipe section to form the construction.

To aerate the total flow of water irrespective to the quantities going through, thoroughly and automatically. At the same time, the regulation of the volume of air supplied is automated. 22.7.78 as 832274. (6pp1045)

ALHA/ ★ D15 84273B/47 ★ DT 2820-275
Membrane filter for microorganisms - with cellulose nitrate filter membrane supported by bosses between flat trays
ALHAUSER E 10.05.78-DT-820275
J01 (15.11.79) B01d-31

A membrane filter, esp. for the sepn. of microorganisms from liquids such as fully desalinated water in combination with ion exchange systems, holds the filter membrane between two flat trays. The membrane is supported across its surface by a grid of projecting bosses which face each other on the inside of the flat trays. Trays and bosses are pref. made of plastics.

The relatively larger free passage area of this filter results in a smaller and more compact design. The components can be replaced at low cost. 10.5.78 as 820275(9pp)

FARH ★ D15 84324B/47 ★ DT 2820-729
Granular fertiliser prodn. from organic sludge - by direct contact with hot gas in a fluidised bed
HOECHST AG 12.05.78-DT-820729
C04 (15.11.79) C02c-03 C05f-07

In the prodn. of granulated fertilisers from organic sludge from biological waste-water purificn. plants, the mechanically thickened sludge is brought into direct contact with hot ($>150^{\circ}\text{C}$) gas in high dilution in a mechanically stirred fluid bed zone with high angular momentum, and the granulated and dried prod. is removed from the fluid bed zone pneumatically by means of the waste gas and separated in a separator.

Drying by direct contact with hot gas at a high ratio of gas to moist sludge gives rapid evapn. of the liq. constituents to leave the solids in granular form. 12.5.78 as 820729(12pp280)

Water softening media regenerating brine - produced from salt suspended from circulation container lid
EURO HAUSGERATE GMB 12.05.78-DT-820818
P28 (15.11.79) A47I-15/42

Brine soln. for the regeneration of water softening media, esp. in domestic dish washing machines, is prepd. in a container with a lid and an inlet and outlet of water. The lid is designed to support the salt which extends as a rock salt cone or loose in a basket to a certain depth. Most of the dissolving activity takes place in the upper part of the container.

This ensures that no water is formed above a satd. brine brine solution and the whole contents have a uniform salt concn. 12.5.78 as 820818(9pp39)

SZOL- ★ D15 84343B/47 ★DT 2820-844
 Thermal degasifier for boiler feed water - incorporates atomising, effervescing and re-boil stages inside domed feed water vessel
 SZOLNOKI VAS ES FAI 12.05.78-DT-820844
 (15.11.79) C02b-01/10

At least one degasifying stage is operated as a reboiling stage, in a process for the treatment of water, esp. of boiler feed water and water to be used as hot water. The degasifying process is carried out in a series of stages using steam, and, in at least one preliminary state, water which has already been degasified, is forced, by reduced pressure to rise and become intimately mixed with the steam. A number of preliminary stages are used for the degasifying process. The reduced pressure is brought about by the adiabatic expansion of primary steam.

Arrangement is designed to achieve the maximal utilisation of the steam, to secure optimal degasifying of the water in a plant occupying the minimum of space. At the same time, hot water for use can be produced from untreated water. The aggressive action of the gases when sepg. out on heating and deposits of scale in the heat exchangers are obviated. 12.5.78 as 820844(63pp1045)

 D/S: E(BE, CH, FR, GB, IT, LU, NL, SW).

Asymmetric dry ultra-filtration membranes contain hydrophobised synthetic silica, which is added to the cellulose acetate casting soln. used to prepare the membranes before hydrolysis.

The cellulose hydrate membranes are more resistant to organic solvents than those of cellulose acetate. The silica prevents loss of flow rate and protein-retaining properties during hydrolysis, and allows the membranes to be dried out for storage after impregnating with glycerol without embrittlement or shrinkage.

11.4.79 as 101117 (18pp195).

 Disinfecting and/or removing algae from water - by mixing with UV-activated oxygen and/or halogen, esp. chlorine
 IHLE INGENIEUR GMBH 27.04.78-DT-818412
 +P34 (14.11.79) *DT2818-412 C02b-03/02 +A611-01 A611-03 C02b-01/34
 D/S: E(BE, CH, DT, FR, GB, IT, NL, SW).

Before mixing with the water to be treated the additive (I), i.e. halogen and/or O₂, is brought to a zone close to the source of radiation, and is dissociated there by radiation. After flowing through this zone, (I) reaches a zone further from the radiation source, in which it is intensely mixed with the water.

Less halogen is needed to achieve the same high degree of disinfection. Proximity to the source of radiation increases the halogen temp. and promotes dissociation.

DAVY- ★ D15 84556B/47 ★EP ---5-319
 Recovery of uranium values from organic extractant - by multistage mixing with acidic aqueous stripping liquid using single settling tank after mixing
 DAVY INTOIL & CHE 12.04.78-US-895721
 E31 K07 M25 (14.11.79) C22b-60/02
 D/S: E(DT, FR, IT, SW).

Uranium values are recovered from an organic extractant phase contg. uranium as a dissolved complex by multistage mixing with an acidic aq. stripping phase, the pH in the first stage being fixed at a certain value and

ing increased in at least one of the subsequent stages
a value less than that at which precipitation of the U
lues would occur.

The degree of agitation in each stage is controlled so
at the dispersed droplets of one phase in the other sep-
ate completely into two layers under gravity after
mixing is stopped. The two phases are passed in co-
current from one mixing stage to the next.

Apparatus for the multistage mixing and final rec-
ery of the separated phases is also claimed.

The method is intended as part of a process for U
covery from its ores, e.g. the Bufflex, Eluex, Amex or
rlex processes.

By controlling the size of the droplets formed during
mixing so that the dispersion separates easily under
gravity, the need for separate settling tanks is avoided.
This not only saves space and reduces fire hazards ass-
ociated with the settling tanks but also avoids the hold
of large amounts of uranium in each stripping section
and reduces the amount of organic extractant required.

4.79 as 300550 (36pp909).

FRH ★ D15 84590B/47 ★EP ---5-390
aternised melamine glyoxal resins - useful flocculating agents
crude and waste water

SOC FRANC HOECHST 24.04.78-FR-012092

A21 (A97) (14.11.79) C02b-01/20 C02c-05/02 C08g-12/32
S: E(BE, CH, DT, FR, GB, IT, NL, SW).

Crude natural or effluent waters are treated with cationic
minoplast resins made by quaternizing a resin which has
been prep'd. by condensn. of melamine (opt. together with
small amts. of urea) with glyoxal or a mixt. of glyoxal
and HCHO. Pref. the resin is quaternized with dimethyl
phosphate.

The quaternized resins are stable on storage and give
cellent flocculation and decolourization of crude waters
with very low addns. of resin (e.g. 2-500 ppm). Organic
and mineral materials present in the water in suspension
emulsion are flocculated out in a form suitable for
recanting. The resins form less sludge than known
mineral flocculating agents and the sludges are easily
rewatered or incinerated. The resins are less sensitive
pH, do not introduce electrolytes into the water, do not
modify the pH, and are effective on their own without the
Edn. of additives such as activated silica.

4.79. as 400256 (15pp513).

ISR: FR2257548; FR1602233; US3484837; US3880753.

05/02 D21h-03/68

S: E(BE, CH, DT, FR, GB, IT, LU, NL, OE, SW).

Compsn. is a soln. of $Al_2(SO_4)_3$ (I) and polynuclear com-
plexes of formula

$Al_m(OH)_n^{(3m-n)+}$ (m and n are integers; esp. the

ratio n:m is 2.3-2.7), having pH between 3 and highest
possible value without pptn. of $Al(OH)_3$.

Compsns. are prep'd. by dissolving (I) in water to give
soln. 0.02-2.3M in Al, then adjusting the pH with base
p > 2.9.

For purifying water, sizing paper and dewatering
plants, (e.g. sugar beet press residues). Compared with
(I) solns., they are more effective flocculating agents;
give larger increase in dry matter content of the beet
pulp during pressing, and a more rapid and effective
sizing of paper with resins.

Selective removal of uranium from substances - by alkaline
carbonate leaching of the powdered substance

BOLIDEN AB 08.05.78-SW-005209

E31 K07 M25 (14.11.79) C22b-03 C22b-60/02

D/S: E(BE, CH, DT, FR, GB, IT, NL, OE, SW).

Uranium contaminants are removed from substances
also contg. aluminium, magnesium, calcium and/or iron
by selective leaching using alkaline carbonate. The sub-
stance is finely divided and slurried in the aq. soln.
contg. 0.3-1.5 mol./l. carbonate ions and having an
oxidation potential of 0.3-1V, and after the leaching
process the leaching liquid has a pH of 8.5-10.5 at
0.2-2.0 MPa.

The method is useful for removing the radioactive
uranium content of a large number of industrial products,
including fertilisers and building materials, and is par-
ticularly useful for treating kerogen-contg. substances
such as slates and shales.

Alkaline leaching gives a selective removal of
uranium, without removing Al, Mg, Ca or Fe, at a
higher yield than acid leaching.

7.5.79. as 850040 (10pp909).

Method for sepg. Cd^{2+} from aq. soln. at 20-25°C and pH 6-9 (pref. 7), comprises adding 1-10 (2-6) equivalents sodium di(2-ethylhexyl)sulphosuccinate (SDSS). Air, nitrogen or another gas is bubbled through the treatment system at a rate 0.01-0.5 volumes (w.r.t. aq. soln.) per min. The SDSS complexes Cd^{2+} and is adsorbed by the bubbles and sepd. as scum from the aq. soln.

The scum is increased in stability by adding 0.5-20 (1-5) mg/l of a foaming agent to the soln. This prevents it redissolving and it is continuously removed from the system.

Greater than 90% of Cd^{2+} is removed from aq. solns. contg. 0.1-1.0 mg/l. 3.4.78 as 039013 (3pp53)

Semipermeable membrane appts. - comprises semipermeable tubes connected as reed screen

NITTO ELECTRIC IND KK 03.04.78-JA-039620
A88 J01 (12.10.79) B01d-13

Semi-permeable membrane appts. is constructed with a number of semipermeable tubes connected as reed screen. The appts. is related to spaghetti-like module of the tubing. The cpds. is produced easily without the following troubles seen previously. Semipermeability of cpds. fails by heat when both ends of tubes are treated with thermoelastic epoxyresin. Tubes are sometimes clogged with thermoelastic epoxyresin.

Specifically, the tubes are connected by tying with strings. The space in tubes is sealed at both ends by a suitable sealant. The dias. of tubes are usually 1-5 mm. 3.4.78 as 039620 (4pp42)

Prod. of sepg. membrane from acrylonitrile based polymer - by dissolving in DMF contg. formamide, forming membrane and removing solvent

JAPAN EXLAN KK 03.04.78-JA-039334

A14 J01 (A94) (12.10.79) C08j-05/18 C08j-09/28
Method comprises dissolving an acrylonitrile based polymer in DMF contg. formamide to form a film-forming soln. forming a membrane having a desired shape from the soln. while keeping the temp. of the soln. higher than the gelation temp. defined below and removing the solvent.

The membranes have excellent mechanical strength and a desired rate of permeation, efficiency of salt removal etc. They can be used as microfiltration membranes, ultrafiltration membranes, reverse osmosis membranes, etc.

The content of acrylonitrile in the polymer is ≥ 80 wt. %. The gelation temp. is measured as follows: 150-180 g of a stock soln. is placed in a beaker of ca. 5.5 cm dia. and ca. 11 cm height and the beaker is dipped in a water tank. The temp. of the tank is lowered at ca. 10°C/hr. At any point of this temp. decrease, a glass rod having dia. 3 mm and weighing 2.5 g (the top end being supported with a ring clamp) is placed vertically on the liq. surface. The rod sinks through the soln. and the time required to reach 5 cm depth from the surface is measured. The temp. at which the time above exceeds 5 sec. first is designated as the gelation temp. During the membrane formation, the soln. is pref. kept 1-50° higher than the gelation temp. 3.4.78 as 039334 (6pp119)

Treating turbid water used e.g. in tunnelling or boring (oil) wells - by coagulation sedimentation treatment by adding sodium carboxymethyl-cellulose and aluminium salt

DAICEL KK (SANY) 06.04.78-JA-039741
A97 H01 J01 (A11) (15.10.79) B01d-21/* C02b-01/20 C02c-05/02

The turbid water is coagulation sedimentation treated by adding a Na CMC salt and adding a water-soluble Al salt, e.g. Al_2Cl_6 and alum etc., the amt. of which is 7-12 vol. times as that of CMC as 10%-soln. The water thus treated is adjusted to a pH of 5.0-9.0 (6.0-8.0), with water-soluble alkali matter, e.g. NaOH and $\text{Ca}(\text{OH})_2$ etc.

CMC is used in combination with the Al salt, to obtain a better coagulation sedimentation effect than that in the case of when Al salt is used only. The supernatant liquor is transparent after the treatment. The sludge is easily dewatered and so is easily transportable and suitable for use in land reclamation. Process is used for treating water used for washing minerals, etc. or in excavating tunnels or boring (oil) wells. 6.4.78 as 039741 (5pp34)

Treatment of municipal sewerage - by sedimentation using calcium hydroxide and anionic polymer coagulant, followed by biological treatment

EBARA INFILCO KK 04.04.78-JA-038809
A91 (15.10.79) C02c-01/02

Municipal sewerage contg. domestic waste water, etc. is effectively treated by adding $\text{Ca}(\text{OH})_2$ and anionic polymer coagulant (e.g. acrylamide-type) to cause coagulation sedimentation and subsequently subjecting it to biological treatment. The amt. of $\text{Ca}(\text{OH})_2$ is ≥ 50 mg/l in terms

of CaCO_3 and $< 200\%$ of non-calcium bicarbonate alkalinity contained in sewerage, and the amt. of the anionic polymer coagulant is 0.2-0.5 mg/l.

Removal of suspended matter and BOD components is increased in the coagulation sedimentation procedure, and the subsequent biological treatment takes place under that state without any neutralisation; generation of difficult to filter surplus sludge is decreased and it becomes possible to carry-out nitrification of ammonia even under high BOD load. 4.4.78 as 038809 (3pp34)

Ethylene-vinyl-alcohol copolymer membrane for selective sepn. - produced by melt moulding elongation and wet heat treatment, then dipping copolymer into non solvent

NIPPON SYNTH CHEM IND 05.04.78-JA-040661

A88 J01 (A17) (15.10.79) B01d-13/04

An ethylene-vinyl alcohol copolymer membrane for selective sepn., is produced by melt moulding, elongation and wet heat treatment of ethylene-vinyl alcohol copolymer, then dipping it step by step into a non-solvent whose solubility parameter is 1.45 to 7.

The membrane has good mechanical strength and selective sepn. capability and is inexpensive. It can be used for the concn. of water contg. acid, alkali, organic substances and solvents, desalination of seawater and the treatment of plating waste water and pulp waste water.

In an example, ethylene-vinylalcohol copolymer, whose ethylene content is 30 mol.% and saponification value is 99 mol.%, was spun at 230°C by a 20 mm ϕ extrusion-type spinning machine. It was then elongated six times at 160°C , and wet heat treated with water and a small amt. of dimethyl sulphoxide, at 80°C for 2 sec. It was then dipped in a methanol (SP = 14.5) bath for 10 mins. and then dipped in an isobutyl alcohol (SP = 10.5) bath for 10 min. It was then dipped in a toluene (SP = 8.9) bath for 10 min. The outer and inner dias. of the resulting hollow fibre membrane was 300 and 250 μm respectively and its strength 3 g/d and young modulus 520 kg/mm^2 . 5.4.78 as 040661 (3pp96)

Maize and fodder beet fertiliser prodn. - using ion-exchanger regeneration waste soln. from metal plating plant waste water purificn.

VORON AGRIC INST (UYVO=) 16.06.77-SU-498163
C04 J01 M11 (28.02.79) C05d-09/02

Waste ion-exchanger resin regeneration aq. soln. formed during the treatment of aq. industrial waste from metal plating plants is used as agricultural fertiliser for increasing crop yield of maize and fodder beets.

The waste contains alkali metal, zinc chromium and other metal salts (nitrates, sulphates, phosphates and chlorides). The soln. is evapd. and salts are opt. crystallised prior to use as fertiliser. The fertiliser stimulates photosynthesis and respiratory activity of plants without accumulation of components in the plant tissue: which are toxic to man or to domestic animals.

Kalinnikov, D.D., Meleshko, V.P., Izmailova, D.R. et al. Bul. 8/28.2.79. 16.6.77. as 498163 (2pp938)

Apparatus for adding gas to liquid - including vertical tube into bottom of which gas is bubbled

WEBB W G 06.04.78-US-894055

J02 (15.11.79) B01f-03/04 C02b-01/18

D/S: N(DK, JA) + E(DT, FR, GB, LU).

An apparatus for adding gases to a liquid includes a vertical, hollow tube at the bottom of which is formed a bell-shaped member. This terminates inside the tube in a throat of smaller cross section than the tube. An annular ring flares outwardly from the throat into abutment with the inside surface of the tube to form an annular chamber between the tube, bell shaped member and ring.

Spaced apertures are positioned around the throat and a gas is supplied to the chamber. A cone is positioned beneath the bell shaped member and gas discharged through the apertures causes a swirling stream of liquid to rise through the tube.

A gas e.g. oxygen can be added to water to remove harmful chemicals and/or to keep biological solids in suspension.

The apparatus produces a high degree of mixing between the gas and liquid.

4.4.79 as US0211 (20pp295)

Treatment of waste water or phosphoric acid - in moving bed ion exchange process, with resin always in packed condition

CARLSON LG 31.01.79-US-007980 (12.04.78-US-895817)

C04 J01 M25 (15.11.79) *EP---4-792 C01b-25/18 + B01d-15/06

D/S: N(BR, DK, JA, SU).

Waste water or phosphoric acid is treated by first being

passed as feed liquid through a resin bed in a loading column. Spent resin is transferred to a regeneration reservoir column then it is passed to a regeneration column by a laminar movement. Then the resin is passed to a loading reservoir column, in which it is rinsed, then it is passed in a laminar movement into the loading column.

Waste water (e.g. municipal or industrial waste water or waste water from ore mining or process tailing) or phosphoric acid is purified to remove contaminants or to recover valuable materials. In the process the resin is in a packed condition at all treatment times so that it has additional advantages over the usual moving bed systems. With this process when the resin is moved through and between the various vessels or columns, need to ensure retention of the liquid-to-resin relationship in phase is reduced. The resin is used efficiently and even high vols. of raw H_3PO_4 highly loaded with ions can be treated.

Aeration of liquid by pumping past gas nozzle - by propeller blades on rotating tube terminating in nozzle

AERATION INDS INC (INHO/) 21.04.78-US-898983

J02 (15.11.79) C02b-01/34 C02c-05/04

D/S: N(BR, DT, GB, JA, SU, SW, US)

In an aeration apparatus air is introduced into a body of

liquid via an inclined tube terminating at its lower end in a nozzle. The tube is rotated about its axis and carries propeller blades near its lower end to pump water past the nozzle to become aerated. Preferably a set of diffuser plates is mounted downstream of the nozzle and rotated by the tube to break up bubbles discharged by the nozzle.

The propeller blades have a rake which is negative at the upstream end and becomes progressively more positive towards the downstream end. The leading edge of the blades makes an angle of less than 90° to the tube surface.

The apparatus is used to aerate water in a domestic or municipal facility.

The propeller blades are non-fouling and are arranged so that bubbles discharged from the nozzle do not contact the blades so that their efficiency is not reduced.

D/S: E(BE, CH, DT, FR, GB, IT, LU, NL, SW).

Substrate for the determ. of alpha-amylase based on particulate starch derivatised with determinable gps., consists of surface-crosslinked starch or amylose granules of diam. 0.01-0.20 mm with a controlled redn. in swelling capacity.

The substrate is used in alpha-amylase determns., e.g. in determ. of serum alpha-amylase activity, which is an important clinical parameter for pancreatic function.

The substrate is uniform, both within a batch and from batch to batch, and gives improved linearity of absorption. This makes the repeated determ. of calibration curves

unnecessary.

Microbiological prodn. of glyceride oil - by aerobic cultivation of yeast on medium contg. fatty acid
CPC INTERNATIONAL INC 08.05.78-US-904099
(D13 D23) (14.11.79) C07c-67 C12b-03/12 C12d-13/08
D/S: E(BE, CH, DT, FR, GB, IT, NL)

Microbiological prodn. of oil comprises aerobic cultivation of suitable yeast cells in a medium having as C source a 10-20C fatty acid, then harvesting the cells and recovering the intracellular oil.

Pref. the C source is 0.5-5 wt. % as C and the medium also contains an N source at 0.005-0.02 wt. % N (by wt. of medium). Suitable yeasts are *Rhodospiridium*, *Lipomyces*, *Candida*, *Saccharomyces*, *Endomyces* and *Rhodotorula*, and cultivation is at pH 4-6 and 20-40°C.

This C source improves oil yield (cells contain > 50 wt. % oil on dry cell basis) and allows control over the chemical nature of the oil. The prod. is useful e.g. for making a cocoa butter substitute.

A venting attachment for a shaking retort is adapted to receive a stopper which is permeable by gas but not by bacteria and which, in use, is protected from liq. splashes from the retort. The attachment comprises a hollow, spherical ventilating portion (I) and a tubular splash baffle (II). (I) has a pipe connecting the retort with the interior of (I) without extending into the sphere. (II) extends into the sphere interior from the opposite direction to the pipe and also protrudes out of (I). This protrusion can receive cotton wool and/or gauze stopper, etc.

(II) is so shaped as to preclude linear communication between the stoppered part of the protrusion and the main tubular opening of (II) in the interior of the retort, to prevent or minimise the likelihood of the stopper being splashed by liq. during shaking of the retort.

A high shaking frequency for ventilation of the retort contents is possible. The retort may be filled to a greater capacity. 26.10.76 as 044378 (3pp976)

(D13) (21.11.79) *DT2632-139 + C07g-07/02

A Koji making method comprises circulating a ventilation gas through materials inoculated with a Koji producing

mould in a closed system contg. a ventilation line, a Koji making chamber and an exhaust line.

The ventilation gas initially contains no free O₂, and is oxygenated on circulating to produce a circulating fermentation-promoting gas. Steam is introduced into the circulating ventilation gas tending to destroy infectious microbes in the gas and to control the temp. and humidity of the gas.

The method can use waste gases such as combustion or flue gas, reducing the risk of contamination by infectious microbes. Koji is made in an all-round method which can carry out steps from steam cooking of raw material to Koji, using one appts. 22.6.76 as 025801 (+23.7.75, 27.2.76, 26.3.76-JA-089176, 020084, 032493)(10pp931)

Brewing miso, syoyu, etc. - in the presence of seaweed ash to increase brewing velocity
HAGIWARAY 03.04.78-JA-038068
(15.10.79) A23I-01/20

Miso syoyu, etc. are prepd. by brewing the material in the presence of the ash of sea weeds. Miso syoyu, etc. which are excellent in taste and flavour, contain useful minerals with good balance and have decreased NaCl content, can be prepd. in a short brewing time without the rancidification and putrefaction due to undesirable microbes.

The ash is obtd. by burning seaweed at 200-1000 (300-600)°C. The ash is extracted with water and the residue is further extracted with water and the residue is further extracted with aq. acidic soln. at pH below 5. The obtd. alkaline extract and acidic extract are adjusted to pH 5-9 respectively and they are mixed. Practically 5-95% of NaCl used in prepg. miso syoyu, etc. is replaced with the extract or its dried prod. 3.4.78 as 038068 (12pp5)

TAKE ★ D16 85063B/47 ★ J5 4132-501
Antibiotic C-15462A used as bactericide and disinfectant - obtd. by culturing Streptomyces microorganism
TAKEDA CHEMICAL IND KK 05.04.78-JA-040581
B04 (15.10.79) A61k-35/74 C07g-11 C12d-09/14

A new antibiotic C-15462A has an elementary analysis: C 70.53 $\pm$ 0.5%, H 4.78 $\pm$ 0.3%, O 25.4 $\pm$ 0.5%; molecular wt. of 324 (mass spectrum m/e); molecular formula: C₁₉H₁₆O₅; m.pt. of 188-193°C; specific optical rotation: $[\alpha]_D^{25}$ - 205 $\pm$ 20° (c 0.137 pyridine).

Antibiotic C-15402A has a specified UV and IR spectra and is insol. in petroleum ether, hexane, benzene and diethyl ether, hardly soluble in (m)ethanol, acetone, ethyl acetate and chloroform and easily soluble in pyridine and DMSO. It has positive colour reaction to 1%

FeCl_3 -1% $\text{K}_3\text{Fe}(\text{CN})_6$ (1:1), negative to magnesium acetate, positive to KMnO_4 ; is neutral; and in the form of yellow crystals.

The antibiotic is useful as bactericide or disinfectant, because it shows an activity against Gram-positive, Gram-negative and acid fast bacteria. Antibiotic C 15462A is prep'd. by cultivating an antibiotic C-15462A-producing strain of *Streptomyces* in a culture medium and recovering the antibiotic from the cultured broth. Example of the strain for producing the antibiotic is *Streptomyces longisporoflavus* No. C-15462 (IFO 13779, NRRL-11287). 5.4.78 as 040581 (10pp53)

Protein hydrolysate prodn. from yeasts - involves fermentative hydrolysis by *Actinomyces* strain followed by additional hydrolysis with specified proteolytic enzyme

AS BELO MICROBIOLOG 09.03.77-SU-461697

B05 E16 (06.04.79) A23j-01/18 C12d-13/06

Protein hydrolysates are produced by subjecting yeasts to hydrolysis by enzymes produced by *Actinomyces cinerascens* 3a; the hydrolysate is then sepd. and dried. This method is improved by subjecting the hydrolysate, before sepn. to additional fermentative hydrolysis by proteolytic enzymes contained in the preparation 'Protosubtilin G-3 Kh' (R TM). By this method, the yeast proteins are effectively split and high mol. wt. polypeptides are obtained. The process is accelerated. The products can be used for various purposes, e.g. as a component of nutrient media for the prodn. of lysine. A hydrolysate produced by the above method, added in an amt. of 1% to a 2% maize extract, ensures complete utilisation of the material.

Shklyar, B.Kh., Shpokene, A.P., Ragavichus, A.B. et al. Bul. 8/28.2.79. 9.3.77. as 461697 (4pp70)

L-asparaginase prodn. for use in medicine - produced by *Erwinia carotovora* in nutrient medium contg. pentose-contg. hydrolysates from vegetable wastes

MICROBIOLOGY INST 23.08.76-SU-399068

B04 (06.04.79) C12d-13/10

L-Asparaginase is produced by *Erwinia carotovora* grown by the deep-cultivation method under aerobic conditions, in a nutrient contg. a carbon source, a yeast extract, $MgSO_4$, K_2HPO_4 , KH_2PO_4 , an ammonium salt and water. This process is intensified, the yield of L-asparaginase is increased and the base of the starting materials is extended by using as a carbon source a pentose-contg. hydrolysate of vegetable wastes. The xylose: glucose ratio is between 0.6:1 and 7:1. Before the introduction into the nutrient medium, the hydrolysate is purified with activated carbon and a resin; and then CaO is added to the

purified soln., pref. in such an amt. that the pH rises 6.8.

The compsn. pref. contains (in wt. %) pentose-contg. hydrolysate 0.5-1.5, an ammonium salt 0.3-0.5, KH_2PO_4 0.3-0.6, K_2HPO_4 0.7-1.4, $MgSO_4$ 0.02-0.05, yeast extract 1.0-4.0; the balance is water.

L-Asparaginase has antilymphatic and immunosuppressive activity, and hence it is used in medicine. Ozolin, R.K., Grivin, P.P., Gertsberg, Z.V. et al. Bul. 8/28.2.79. 23.8.76. as 399068 (3pp70)

Clarifying wines using e.g. palygorskite suspension - is intensified by subjecting the suspension to activating cavitation in circulation circuit by varying pressure KRASD POLY (ENZY=) 17.01.77-SU-445769 (06.04.79) C12h-01/02

Aq. suspension of a clarifying material (e.g. palygorskite) used for wines, is prepd. by forcibly circulating the suspension in a closed circuit. The activity and uniformity of the suspension is improved by changing, at least twice, the pressure in the closed circuit, namely the initial pressure is reduced to the pressure of satd. vapour pressure at the max. speed points, and then again raised to the initial value.

By this method, cavitation is created in the suspension and water contained in the pores of palygorskite evaporates instantaneously, whereby the palygorskite particles burst, yielding highly active fragments. Thus, the clarification is rendered more effective. The consumption of the palygorskite is reduced from 1.0-1.5 g/l. to 0.2-0.5 g/l. in case of wines, and from 2.0-3.0 g/l. to 0.5-0.7 g/l. for stronger drinks. Identifying microorganisms by their DNA content - involving separating from cells by lysis and comparing with DNA of reference strain

MOSCOW LOMONOSOV UNIV 14.06.77-SU-498970

(06.04.79) C12k-01/04

Microorganisms can be identified by separating cells from a culture; subjecting them to lysis; sepg. DNA (desoxyribonucleic acid) from the lysate; purifying and hybridising the test DNA with the DNA obtd. from a reference microorganism strain; and determining the homology percentage in the resulting nucleotide system. This process is simplified and accelerated by carrying out the cell lysis at 37-50°C for 30-60 min., sepg. the DNA from the lysate using a 1.5-2.5 fold quantity of ethyl alcohol; purifying by treatment with 0.54-0.6 vol. % of isopropyl alcohol and effecting hybridisation within 8-10h. The total duration of the process is 11-13h. High accuracy is attained.

DNA is labelled with C^{14} -thymine. Pulse-counting in a homogeneous system is taken as 100% homology. For example, a homology of 89% was found in the system of *E. coli* 761 vs. DNA of *E. coli* VZT (reference strain). Antonov, A.S., Belousova, A.A., Lysenko, A.M. et al. Bacterial rodenticides for cereals - are prepd. by soaking air-sterilised grains with bacterial culture under reduced pressure, and then drying

AS ARMN MICROBIOLOG 02.08.76-SU-393719
C03 (06.04.79) A01n-15 C12k-03

Bacterial rodenticides are prepd. by soaking sterilised grains with bacterial culture, effecting growth of the bacteria on the grains, and drying the prepn. The process is simplified and the cost is reduced by carrying out the sterilisation of the grains with dry air at 100-120°C, and performing the soaking with a bacterial culture under reduced press. (0.8 atm.) at 25-30°C, for 0.5-1 h; and then returning to the atmospheric press. within 5-15 min.

The pressure reduction promotes deep penetration of the bacteria into the grains. The bacterial culture (e.g. rodent typhus bacteria) is grown at 37°C for 14-16 h. The grain soaking lasts 1h. Then the soaked grains are air-dried at 40°C for 1h.

Purifying vegetable material hydrolysates - by introducing lignin dissolved in alkali soln. to effect absorption of organic impurities by resultant lignin flocs

ARCANGEL FORESTECH 10.10.77-SU-534449
F09 (28.02.79) C13k-01/04

Hydrolysates of vegetable materials are purified, according to the Parent Patent No. 423841, by contact with insoluble lignin, which absorbs organic impurities. This method is improved by first dissolving lignin, or its derivative, in an alkali soln. The lignin-contg. soln. is poured into an acid hydrolysate whereby lignin is precipitated in the form of flocs, which absorb the organic impurities, and can then be sepd. by known methods. Due to the very large specific surface area of the lignin flocs the consumption of lignin can be reduced to about 2g/l. (i.e. 15-25 times less than in the Parent Patent), and yet the purification effect is enhanced 3-5 times. This method can be used in the microbiological and cellulose industries.

Low pressure preliminary dewatering of bagasse - with multiple rearrangement of fibre layers and uninterrupted pressure cylinder working

KAETHER W 05.05.78-DT-819719 (00.00.76-DT-657232)

(15.11.79) C13c-03

In a process for reducing the moisture content of bagasse, the cane is treated by passage through a diffuser followed by dewatering mills working at high pressure. The sugar content is washed out in the extrn. zone of the diffuser by spraying with extrn. fluid in countercurrent. At the outlet of the diffuser, the cane is subjected to a preliminary dewatering operation by large dia. cylinders exerting low pressure.

During the uninterruptedly progressing pressing operation, the bagasse layers are subjected to multiple displacement and rearrangement, and it is fed through differently constituted, successive, interrupted pressing zones. As distinct from the preceding flat pressing and screening surface, the following screening surface is a curved one, and the originally flat package of bagasse in the flat pressing zone, has imparted to it, a curved form, under the influence of the curvature of the low pressure cylinder. The interrupted transition zone between the flat and the curved pressing zones, is positioned where the highest degree of longitudinal thrust of the package of bagasse deformed by the low pressure preliminary dewatering cylinder occurs.

Improvement relates to special measure and their use in combination so as to ensure an uninterrupted, and smooth transition of the mass of bagasse, from the flat to the curved pressing zone, and to make possible an additional dewatering in the transition zone. The special measures are applied in the zone at the ends of the chains where there

is no screen. They consist on the special corm of the sta of the curved pressing zone; the positioning of the transition zone relatively to the low pressure cylinder and its height relatively to the flat pressing zone. 5.5.78 as 8197 Add to 2657232, 2716666 (11pp1045)

Massecuite crystalliser column - with alternately inverted conical deck plates and cooled paddle mixer

SELWIG & LANGE MASC 13.05.78-DT-821129

(15.11.79) C13f-01/02

A crystalliser column for massecuite in the sugar industry has several decks of conical plates, with every other cone inverted. Each apex of an inverted cone forms with vertical paddle mixer shaft, and the outward edge of each normal cone forms with the column wall the annular slots for the massecuite passage. The paddles are hollow and receive, together with their shaft, a coolant in counter flow to the massecuite.

This creates a clearly defined passageway for the massecuite so that the heat transmission is improved and a high throughput is achieved without excessive input for the paddle mixer. 13.5.78 as 821129(13pp39)

NATT D17 ✓ 74669B/41 = GB 1556-4
Cold water swelling starch prodn. - by two-stage crosslinking starch with sodium trimetaphosphate, useful as thickener foodstuffs

NAT STARCH & CHEM CORP 20.03.78-US-888382

A11 (A97 D13) (21.11.79) *NL7900-914 + C08b-31 06

Cold water swelling starches are prepd. by reacting a granular starch base in a prim. crosslinking step with sodium trimetaphosphate in an aq. slurry at pH 10-12, at a temperature low enough to maintain the starch in a unswollen granular

ate.

The resultant slurry is neutralised to a pH of 5-6.5 and a prim. crosslinked granular starch recovered. The starch obtd. is reslurried and the pH adjusted to ≥ 7.5 , and additional sodium trimetaphosphate added. The resultant slurry is drum dried to effect a sec. crosslinking reaction in situ, from which a sec. crosslinked starch prod. is recovered.

Starches formed are esp. used in foodstuffs, such as fruit pie fillings or tomato sauce. 25.5.78 as 022302 (5pp931)

Glucose prepn. by enzymatic hydrolysis of cellulosic material - involves treating with ethylene to increase glucose yield on enzymatic hydrolysis with cellulase
GREAT WESTERN SUGAR 22.06.77-US-808812
E13 (D16) (21.11.79) *US4097-333 C13k-01/02

Glucose is produced by the enzymatic hydrolysis of cellulosic material by contacting the material with ethylene and hydrolysing (part of) the material to glucose.

The material is contacted with ethylene prior to or during hydrolysis. The material is dispersed in water and ethylene gas bubbled through the dispersion at a rate > 1 cc/min/1000 ml of dispersion to contact the material.

Glucose yields are enhanced in the process, esp. when lignin associated with the material is degraded before hydrolysis. 25.5.78 as 022752 (5pp931)

Rubber stopper used to measure length on root canal in dentistry - prepd. by vulcanising mixt. of silicone rubber, vulcanised rubber and bismuth trioxide

TOYO KAGAKU KENKYUS 10.04.78-JA-041899

A96 P32 (A26 A60) (17.10.79) A61c-05/02 A61c-19/04

A rubber stopper used in dental treatment consists of rubber obtd. by mixing silicone rubber and vulcanised rubber with bismuth trioxide (Bi_2O_3), and vulcanising the mixt. For example, the compsn. of the rubber consists of 100 pts. wt. of silicone rubber and 10 pts. wt. of Bi_2O_3 .

The rubber stopper is used for treating the root canal and is mounted on a reamer for this purpose. The rubber stopper is non-toxic and visible on an X-ray film. Thus the length of the root canal can be easily measured by using the reamer with the stopper. The rubber stopper is easily sterilised and it can be easily cut into a desired shape. 10.4.78 as 041899 (2pp2)

Improving water solubility of lecithin for use in e.g. shampoo - by use of tert. amine oxide or specific surfactant as solubiliser

AMERICAN LECITHIN 04.12.78-US-965998

E19 (13.11.79) A23i-07 B01i-13 C11d-09 30

The solubility of lecithin is improved by adding to an aq. dispersion of the lecithin a solubilising agent selected from tert. amine oxides, alkyl alcohol sulphate salts, alkylamidopropyl betaines, sodium alkene sulphonates, alkyl sulphoacetates and disodium salt of monoalkyl amide

of sulphosuccinate.

Clear, stable aq. solns. of lecithin can be prepd. at room temp., such solns. being infinitely dilutable. The lecithin can be incorporated into skin and hair care prod in the water phase of an emulsion instead of in the oil phase. In such cosmetic or toiletry compsns. the lecithin acts to influence the elasticity of skin and hair; it softens hair, imparts sheen, improves body and reduces its electrostatic charge. 4.12.78 as 965998 (8pp914).

ICIL D21 36916A/21 = US 4174-3
Dental or orthopaedic powdery cement - consisting of ternary ox. contg. alumino-borate glass powder and water-soluble poly. contg. carboxyl gps.

IMPERIAL CHEM INDS LTD 12.11.76-GB-047211

A96 L01 (13.11.79) *DT2750-326 + C081-33

Cement compsn. comprises (a) an alumina borate glass powdered form contg. fused oxides of Al, B and a third oxide, of an alkali(ne earth)metal, and (b) a water-soluble organic polymer comprising a polymer chain contg. recurring carboxylic acid or carboxylate ion gps. (pref. poly(meth)acrylic acid). A fourth component, an inorganic oxide or salt is pref. also present; and is Pb oxide, SiO₂ or a P oxide.

Used esp. to produce dental cements, or dental filling or cavity lining materials. 7.11.77 as 849360 (5pp997).

FARB D21 27121A/15 = US 4174-3

Impregnated germicidal cloth or paper mfr. - by impregnating resin soln. contg. copper and/or silver powder, used for mfg. clothes

NIPPON ION KK 31.03.78-JA-038552

A87 B06 F06 (A97 F09) (11.10.79) A01n-11 D06m-11 D21h-

A cloth or paper is impregnated with a resin soln. containing copper powder, silver powder or its cpd. or a mixt.

thereof. As the resulting impregnated cloth or paper has germicidal action, the cloth or paper is pref. used as clothes for babies, e.g. swaddling cloths, underclothes and bandage.

In an example, to 100 pts. wt. of a 30% DMF soln. of polyurethane is added 10 pts. wt. of copper powder (2-8 μ particle size) and 90 pts. wt. of DMF and themixt. is uniformly stirred. Woven cloth is immersed in the soln. and squeezed to 100% pick up and then immersed in flowing water and allowed to stand for 30 mins. and then dried. 3.78 as 038552 (4pp84)

IIIO- ★ D22 84980B/47 ★ J5 4132-201
Fungicidal resistant synthetic leather prodn. - from synthetic resin contg. copper and/or silver cpd.) powders
NIPPON ION KK 31.03.78-JA-038550
A82 F08 (15.10.79) D06n-03.

Cu powder, Cu cpd. powder, Ag powder and/or Ag cpd. powder is added to a synthetic molten resin and the resulting synthetic resin is moulded as into sheet form.

As a raw material of the synthetic resin, polyacrylic resin, PVC, EVA copolymer, polyurethane, urethane resin, polyamino acid resin, polyamide resin or synthetic rubber may be used. This may contain a crosslinking agent such as polyisocyanate. 100 pts. wt. of synthetic resin are mixed with 5-100 pts. wt. of powdery metal component(s) and an appropriate amt. of pigment for producing the synthetic imitated leather.

Above synthetic leather is used for sheet cover of furniture. 31.3.78 as 038550 (4pp15)

Fungicidally treated decorative ligneous board prodn. - by immersing flitch in boiling water, slicing into small thicknesses and treating with fungicide and wood preservative

MITSUI TOATSU CHEM INC 06.04.78-JA-039736
C02 E13 F09 P63 (15.10.79) B27k-03/02

A flitch is immersed in a boiling water and is sliced into boards having small thickness. The boards in wet state are treated with a fungicidal agent and a wood preservative agent.

The fungicidal agent is benzimidazole, benzisothiazole, benzthiazole, 2-(4-thiazolyl)benzimidazole, tetra-chloromethyl-sulphonyl-pyridine, tetramethyl-thiuram-disulphide, N-(fluorodichloromethylthio)-phthalimide or zinc lithiocarbamate salt. The wood preservative is chosen from hexamethylenetetramine, salicylic acid, formaldehyde, chloroacetoamide, N-methylol-chloroacetoamide, benzoic acid, sodium benzoate, 2,4,5,6-tetrachloro-isophthalonitrile, Na salt of acetoacetic acid, ethyleneglycol ester of monobromo-acetic acid or 4-(2-nirobutyl)-morpholine.

The resulting thin board has beautiful grain figures and ≥ 0.3 mm thickness. It is laminated on low quality wood block such as white Lauan. Dentacme contorta Merr et Rolfe by using an adhesive of urea-formaldehyde by heating and pressing step. 6.4.78 as 039736 (4pp15)

Insecticidal compsn. esp. for combating ants - contain an iodoacetylene alcohol, also has fungicidal activity in wood material, leather, synthetic resin etc.

SANKYO KK 05.04.78-JA-039971
A60 C03 E16 (15.10.79) A01n-09/30

Ant controlling agent contains as active component iodoacetylenealcohol of formula $\text{IC} \equiv \text{CHR}_1\text{-OH}$ (I) (where R_1 is H or lower alkyl).

(I) shows excellent insecticidal effect to harmful insects for wood such as white ant. (I) also shows fungicidal effect to fungi which generate on and damage wood material, wet pulp, paper, fibre, leather, adhesive, paint, synthetic resin etc. It has a low toxicity to human beings.

In an example, 10 pts. (I) was dissolved in 40 pts. of DMF and 40 pts. of xylene and 10 pts. of polyoxyethylene-nonylphenylether were added to prepare the emulsion. The emulsion was diluted at the time of use, and the diluted liq. was coated on or sprayed on wood. 5.4.78 as 039971 (4pp108)

SATO/ ★ D22 84996B/47 ★ J5 4132-238
Deodorant for use in shoes - contains montmorillonite, pyroligneous acid and papain enzyme, and is used in a small permeable bag

SATO M 05.04.78-JA-040491
P34 (D16) (15.10.79) A611-09/*

Deodorant for shoes is obtd. by mixing about 80% of montmorillonite, about 20% of pyroligneous acid and minor amt. of papain enzyme, kneading the mixt. and formulating the kneaded product as pellet, followed by drying. Deodorant bag for shoes is obtd. by charging the pellets produced above in a small and permeable bag.

Montmorillonite has an absorption activity 5 times as high as activated carbon. Pyroligneous acid is by-produced together with wood tar in the dry distillation of wood, and contains as major component acetic acid. It has a sterilising effect. The bag is made of paper, cloth, unwoven fabrics, etc.

When the deodorant is placed in shoes, the nasty smell in the shoes is absorbed by montmorillonite, decomposed by papain enzyme and reduced by pyroligneous acid. Therefore, shoes can always be kept clean. The deodorant also cleans the skin surface, and is useful for the treatment of athlete's foot. 5.4.78 as 040491 (2pp108)

Microbiological growth control in photo processing washing water - using 1-bromo-3-chloro-5,5-dimethylhydantoin, pref. incorporated in filter housing

DEEGAN RO 20.10.79-RD-187051

E13 G06 (D15) (10.11.79) C02b-00/*

Microbiological growth is controlled using 1-bromo-3-chloro-5,5-dimethylhydantoin. This agent prevents microbiological growth from occurring or greatly reduces the extent of growth. It functions by slowly releasing chlorine and bromine into the photo-processing wash water and is effective in very small amts. e.g. 50 grams is sufficient to control microbiological growth in the wash water of a typical processing appts. It is useful in both black-and-white and colour processing.

Pref. the agent is incorporated in a filter housing which is placed in the wash water line just prior to the point where it enters the wash tank. A series of valves can then be arranged to direct all, some or none of the wash water through the filter housing to thereby have an appropriate amt. of the 1-bromo-3-chloro-5,5-dimethylhydantoin enter the wash tank as needed. B07 (B05 D13) (15.11.79) *DT2747-765 A23d-05 C11b-07

A fat contg. 45-80% 1, 3-di-palmitoyl-2-oleoyl glycerin (I) is prepd. by fractionation treatment of palm oil with an organic solvent. Process comprises (a) crystallising a fat fraction (m.pt. $> 45^\circ\text{C}$) at $17-35^\circ\text{C}$ and sepg. the 1st crystal fraction from the oil fraction, (b) crystallising a 2nd crystal fraction from the oil fraction at $10-25^\circ\text{C}$, and (c) washing the 2nd fraction with 8 times the amt. of organic solvent at -5 to $+15^\circ\text{C}$ to obtain a 3rd crystal fraction of high (I) content, or (d) dissolving 2nd fraction in an organic solvent, cooling it to -5 to $+15^\circ\text{C}$, crystallising and sepg. a 3rd crystal fraction.

Pref. the solvent is acetone or isopropanol. Fats rich in (I) are used as cocoa butter substitutes in the chocolate and pharmaceutical industries. Palm oil with an initial (I)-content of ca. 30% can be easily enriched. As the organic solvent is used only in the final stage, costs are reduced for providing a large plant protected against explosion risks. 25.10.77 as 747765. (3pp913)

Determn. of content of volatiles in non-aq. liq. - includes content liq. with porous diaphragm having continuous micro sweeping other side with inert gas, analysing carrier gas

KANEGAFUCHI CHEM KK 31.03.78-JA-038458

E17 J04 R16 (11.10.79) G01n-33 26

Volatiles present in non-aq. liq. are continuously

intermittently) determined by a method comprising (1) keeping the non-aq. liq. contg. volatile impurities (e.g. vegetable oil contg. traces of n-hexane) in contact with one side of a liq.-repellent porous diaphragm having continuous micropores, (2) sweeping the other side of the diaphragm with an inert carrier gas (typically nitrogen or helium), and (3) leading the carrier gas to a detector where the volatile impurities diffuse through the diaphragm into the carrier gas and are continuously (or intermittently) analysed. The method permits rapid and accurate determination of volatile impurities in non-aq. liq.

The carrier gas (nitrogen or helium) is passed through porous diaphragm, pref. at a pressure $\Delta P = 2\gamma \cdot C \cos \theta / R$, wherein ΔP is the pressure difference between the liq. and the carrier gas, γ is interface tension between the diaphragm and the liq., θ is contact angle between the diaphragm and liq., and R is micropore dia. The carrier gas is then led to the detector (e.g. gas chromatograph). 11.3.78 as 038458 (6pp173)

Quantitative analysis of solid phase in fat - from nuclear magnetic resonance measurements by echo signal amplitudes in pulse sequence

NW CORRESP POLY 19.10.76-SU-413056
B05 J04 R16 (25.04.79) G01n-27/78
The known quantitative analysis of the solid phase in fat from nuclear magnetic resonance measurements involves recording the nuclear magnetisation intensity signal of thermally stabilised specimens of the same weight. For greater accuracy, echo-signal amplitudes are measured in a two-pulse sequence with consecutively different lags τ_1, τ_2 between them to apply a formula for the percentage content. Use of echo signals eliminates error whether in the laboratory or e.g. foodstuffs industry. The formula is

$$\frac{A_{1p}(\tau_2)A_{st}(\tau_1) - A_{1p}(\tau_1)A_{st}(\tau_2)}{A_{sp}(\tau_1)A_{1p}(\tau_2) - A_{sp}(\tau_2)A_{1p}(\tau_1)}$$

where A_{1p} is echo signal amplitude of entirely molten

specimen; A_{st} is echo signal amplitude at set temperature; A_{sp} is echo signal amplitude at fat solidification; τ_1 and τ_2 are time lags between 90-180° pulses. Other fields of application are in pharmaceutical industry, chemistry, biology and medicine.

 dium bi:carbonate-based domestic cleaning agent - contains
 dium tri:poly:phosphate soda ash, magnesium sulphate or
 lorida, sodium metasilicate and sodium hypochlorite
 BATYGIN VG 07.03.75-SU-112199

(28.02.79) C11d-07/12

domestic cleaning agent comprises (in wt. %): 5-15% Na
 polyphosphate, 3-10% calcined soda, 3-4% Na meta-
 silicate 3-6% Mg sulphate or chloride, 2-3% Na hypo-
 chlorite and Na bicarbonate to 100%. The agent has high
 eaning power and good stability. The components form
 morphous silica (15-40g/kg), which serves as a mild

abrasive additive that is insoluble in water.

 Aq. cleaning compsn. for metal surfaces - includes a
 polyoxyethylated synthetic fatty acid mono:ethanolamide as a
 surfactant

GETMANSKII K 17.02.76-SU-323606

A97 E16 (A25 E12 E17) (28.02.79) C11d-09/26

Cleaning compsn. is used for cleaning metal surfaces,
 esp. for removing polishing paste, protective grease etc.
 It comprises (in wt. %): 16-32% Na soap of 7-9C synthetic
 fatty acids (I); 4-8% of a polyoxyethylated 10-16C synthetic
 fatty acid monoethanolamide (II); 10-20% triethanolamine,
 10-20% aliphatic alcohol, 0.2-0.5% di-sodium salt of EDT
 A and water to 100%. The compsn. is known as 'Apolir'.
 It has low foaming characteristics. The prefd. aliphatic
 alcohol is ethanol or isopropanol. Standard additives
 such as fragrances etc., may also be included.

In an example, a compsn. contains 160g. (I), 40.0g.
 (II), 100g. triethanolamine, 2.0g. EDTA Na salt, 100g.
 ethanol and 598g. water.

 Liq. detergent-bleach compsn. for cleaning hard surfaces - e.g. of
 metal processing machines, comprises alkali metal-hypochlorite, -
 alkylated di:phenyl oxide sulphonate, -hydroxide and -chloride

BASF WYANDOTTE CORP 28.08.78-US-937691 (27.07.77-US-
 819261)

E12 (D12 D13 E34) (13.11.79) C11d-07/54

A cleaning and bleaching liquid compsn. consists of an aq.
 soln. of (a) 2-15 wt. % (calculated as available chlorine)
 of Na, K or Li hypochlorite, (b) 15-200 wt. % (based on
 the hypochlorite) of an Na, K or Li salt of an alkylated
 diphenyl oxide sulphonate in which the alkyl gps. con-
 tain 8-22C; (c) 5-20 wt. % of Na, K or Li hydroxide; and
 (d) 0.1-1.5 mole of Na, K or Li chloride per mole of hy-
 pochlorite.

The compsn. is clear; stable at room temp., at elevat-

ed temps. and at low temps.; and is useful, upon dilution with water to 0.5-5 wt. % active soln. concn., for general purpose hard surface cleaning at 15-80°C. It is partic. useful in removing animal and vegetable based oily and fatty soil deposits normally encountered on processing equipment on the meat and poultry industry. 28.8.78 as 937691 (4pp914).

BULL-★ D25 85829B/47 ★US 4174-304
Surfactant system for use in floor stripper, degreaser, etc. - comprises synergistic mixt. of nonionic detergent, tert. amine oxide and quat. ammonium halide

BULLEN CHEMICAL 20.12.77-US-862595 (01.08.75-US-601054)

A97 E19 G04 (A25) (13.11.79) C11d-01/62

A novel surfactant system comprises 25-75 wt. % of a non-ionic detergent, 5-55 wt. % of an amine oxide and 8-50 wt. % of a quat. ammonium halide.

The nonionic detergent comprises the condensation prod. of (a) 4-16 moles ethylene oxide with (b) 1 mole of a 7-10C alkyl, phenol, a 12-16C alkyl amine, a 12-16C aliphatic alcohol, or a hydrophobic base formed by condensing propylene oxide with propylene glycol.

The amine oxide is chosen from (1) 10-20C alkyl di(1-7C alkyl)amine oxides, (2) 10-20C alkyl di(1-7C hydroxy-alkyl)amine oxides, (3) 10-20C alkylamidopropyl di(1-7C alkyl)amine oxides and (4) 10-20C alkyl morpholine oxides.

The quat. ammonium halide is of formula $[NR_1R_2R_3R_4]^+X^-$ where (1) R_1 and R_2 are 1-7C alkyl, and R_3 and R_4 are 8-20C alkyl or (opt. 1-18C alkyl-substd.) phenyl; or (2) R_1 - R_3 are 1-7C alkyl and R_4 is (opt. phenyl-substd.) 8-20C alkyl, or (3) R_1 is (opt. phenyl-substd.) 10-20C alkyl, R_2 is 1-7C alkyl, R_3 is $-(CH_2CH_2O)_xH$ and R_4 is $-(CH_2CH_2O)_yH$ (where $x+y = 2-50$).

The surfactant system can be formulated into ammoniated floor stripper and degreaser; non-phosphate cleaner; wax and floor finish stripper; high foam degreasing cleaner; cleaner for glass or other smooth surfaces; or soap film remover. 20.12.77 as 862595 C.i.p. 4065409 (+ 12.9.77 - US - 832364) (9pp914).

PROC ★ D25 85830B/47 ★US 4174-305
Alkyl benzene sulphonate detergent compsn. - contg. cellulose ether as soil release agent

PROCTER & GAMBLE CO 07.06.77-US-804479 (02.04.75-US-560766)

A97 E14 (13.11.79) C11d-01/22 C11d-03/22

A detergent compsn. comprises (a) 5-50 wt. % of a water-soluble (10-12C)alkyl-benzene sulphonate surfactant, this component being free of ≥ 13 C alkyl benzene sulphonates; (b) 0.1-3 wt. % of a water-soluble (hydroxy)alkyl cellulose ether or hydroxyalkyl alkyl cellulose ether, as soil release component; (c) ≤ 70 wt. % of a builder; and (d) the balance being chosen from water, water/ethanol mixts., perfumes, optical bleaches, fillers, anti-caking agents, fabric softeners, perborate, bleaches and/or enzymes.

The use of alkyl benzene sulphonates in which the alkyl chain length is controlled to 10-12C ensures that the soil release properties of the cellulose ether are not impaired. Thus the detergent compsn. provides excellent through-the-wash soil release properties using much less of the cellulose ether material than previously. 7.6.77 as 804479 (10pp914).

MONT D25 63849A/36 =US 4174
Self-sequestering poly(ol ether carboxylic acid deriv. surfactant) used as wetting agents and textile detergent or dish-wash compsn. components

MONTEDISON SPA 28.02.77-IT-020747

E19 F06 (13.11.79) *DT2808-638 C11d-01/04

Self-sequestering surfactants of formula (I) are prepd.

$$R-OCH_2-\overset{\overset{CH_2O-Z}{|}}{C}-CH_2O-Z$$
 in which R is 6-18C alkyl, aryl or alkylaryl, and ≥ 2 of the Z groups are carboxymethylene

(I) $CH_2COO^-Me^+$ where the Me^+ is Na, K, ammonium, quat. onium ion or their mixts. Z may also be H. Pref. (I) is used in amt. 5-60 wt. % of a detergent compsn. when R is a 12-14C linear chain.

Detergent compsn. contg. (I) are esp. used for washing fibrous articles used in the prepn. and serving of food. Fibres are prepd. for spinning, twisting, weaving, felting and dyeing operations by wetting in the detergent. 27.2.78 as 881390 (6pp931).

MANUAL CODE INDEX

IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from unexamined applications (OLS) which are given the normal DT code. In the case of Japan J5 represents unexamined applications, and J7 the examined of present series.

**Includes numbered Basics from Weeks B36, B38 and B41

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose
A+	Polymer Applns.	G	Printing, Coating, Photographic Chemistry
AE	Polymer & General Chemistry	H	Petroleum
B	Pharmaceuticals	J	Chemical Engineering
C	Agricultural Chemistry	K	Nucleonics, Explosives, Protection
D	Food, Disinfectants, Detergents	L	Refractories, Ceramics
E	General Chemistry	M	Metallurgy
E+	General Chemistry Applns.		

Typical Abstract Heading

See CPI/WPI Instruction Manual No. 1A for explanation of the various flagged descriptors.

D1: FOOD; FERMENTATION

D11: BAKING

BERN D11 78922W/48 = DS 2422-560
Dough mixing and kneading machine - supports kneading bowl by claws from lid on bracket with mixing tool and drive
WERNER & PFLEIDERER 09.05.74-DT-422560
(22.11.79) *DT2422-560 A21c-01/14
Dough mixing and kneading machine is fitted with a kneading trough which has along the top rim a solid flange. This fits against a flange of the cover which is a part of the machine structure. Several claws are distributed over the periphery of the lid. They are actuated by vertical double-acting power cylinders and have trunnions which slide in L-shaped grooves. In the applied position, they clamp the two flanges together.
To break the connection, the claws are lowered and finally automatically swung outward. This is a simple method of positioning and fixing the kneading trough and requires little space. 9.5.74 as 422560 (6pp39)

MAAS/ D11 40662A/23 = DS 2654-318
Dipping plate for rolls - with detachable cups in plate recesses for easy cleaning
MAAS-MORANT A 30.11.76-DT-654318
(22.11.79) *DT2654-318 A21c-11
Dipping plate for baking crusty rolls has a pattern of hemispherical recesses, each of which can accept a loose cup of similar shape. Each cup has a wide flange on the periphery with which it rests on a flange around a recess. Four round-headed pins are arranged at the underside of the cup flange, these fit into keyhole-shaped openings in the recess flange in which they are locked by a bayonet movement.

This greatly facilitates the cleaning operation because only the cups need cleaning or replacing. 30.11.76 as 654318 (9pp39)

RIJK- D11 87114B/48 = EP ---5-570
Forming a continuous layer of emulsified material - using shearing action to break down structure of material and improve its workability
MACHINEFAB RIJKAAR (RUTT/) 09.05.78-NL-004983
+P62 Q36 (28.11.79) *NL7804-983 A21c-09/04 +A21c-03/02 B26d-04/78 B65h-29/66
S: E (DT, FR, GB, NL).

A mass of an emulsified material, such as butter or margarine, is formed to a layer of desired thickness by scraping a quantity of the material from the mass and separating a part of that quantity with the required thickness. The parts are then fed together to form a continuous layer of the same thickness.

The scraper pref. comprises a number of scraper blades rotating about a common shaft with a backwardly inclined edge zone. The continuous layer produced is removed from the scraper blades by a fixed blade protruding into the trajectory of the scraper blade tips by an amt. equal to the thickness of the layer. The blade tips are flexible and deform as they pass the fixed blade.

The device is ideally suited to prodn. of pastry crust where it is necessary to form layers of dough and butter or margarine together. The initial shearing action of the scraper blades breaks down the structure of the blocks of emulsified material enabling it to be worked more easily in the further prodn. stages. The material produced is far more workable than layers produced by traditional extrusion or cutting processes and the machinery required is therefore lighter and uses less energy.

INGR- ★ D11 86408B/48 ★GB 1556-815
Easily dispersed gluten additive for food prods. - prepd. by reaction of gluten and xanthan gum
IND GRAIN PROD LTD 27.08.76-GB-035670
A97 (28.11.79) C07g-07
Vital or undenatured wheat gluten modified by reaction with xanthan gum is claimed. The prod. is made by mixing xanthan gum with a dough of wet gluten at pH below 8 until a malleable extensible mass is obtd. which is then frozen or dried.

The prod. is esp. useful as an additive for baked goods. It is easily dispersed, has no tendency to agglomerate, and has greater malleability and water-inhibiting power than ordinary gluten, and gives bread with higher volume and softer crumb.

The pH of the prod. is 5-8 esp. 6.5-7.5. The wt. ratio of gluten to xanthan gum is 200:1 to 4:1 esp. 60:1-40:1. Pref. a buffering or sequestering agent is added, e.g. a citrate EDTA, a phytate, or a phosphate or polyphosphate. Esp. pref. is 0.25-4.0 wt % Na citrate. In preparing the prod. it is important that wheat solubles are excluded as far as possible, and that mixing is not carried out for too long, or a useless pale inextensible rubbery mass is formed.

Inhibition of dust from flour by oil coating - using metering device to proportion atomised oil onto flour pref. in an amt. of 1.5 wt. per cent

NAT COOP AAN CEBECO 12.05.78-NL-005155
(14.11.79) A21d-02 B01f-03/12 B01j-04/02

Flour, esp. tapioca flour, is rendered dust free by spraying it with atomised plant or animal oil in an atomised condition and in the proportion of ca. 1.5% by wt., this being the best proportion to prevent dust without adversely affecting the fluid properties of the powder. The appts. comprises a feeder/seive for the flour, a metering device for the oil, a mixing arrangement for the flour with the atomised oil and a conveyor for removing the mixt.

Used esp. in inhibiting dust pollution of the atmosphere in transferring the flour from sea ships into inland barges or coasters; pref. the installation is built into an intermediate ship between the sea ship and the elevator ship or built into the elevator ship itself.

Fluid properties of the flour are not affected and since the oil is applied to the flour in its finest form, there is no subsequent breakdown of the flour particles to reduce the effectiveness of the treatment. 12.5.78 as 005155 (6pp)

Feed dispenser for fish comprises a feed holder whose lower end is funnel shaped with an opening at the bottom in which a closure element is located. This element is in the form of a toadstool, is capable of vertical displacement and incorporates a head in the form of a truncated cone attached to a cylindrical part. The top of the cone and the bottom of the cylinder are in contact with the walls of the holder funnel so that an enclosed chamber is formed between the two contact lines.
The stem of the closure element is extended by means of a pendulum and is shielded against ingress of water by a funnel shaped casing fixed to the lower end of the holder funnel. When the pendulum is moved so that the closure element is tilted, one half of the above mentioned enclosed chamber is exposed to the water so that the feed can drop whilst the other half is in communication with the holder funnel so that the enclosed chamber is filled again.
This arrangement provides accurate dosing of the fish food into the water whilst preventing water from entering the holder with the consequent bridging. 14. 8. 70 as 22011 (7pp1370)

Lollipop production machine with stick insertion mechanism - has cam driven stamps which form sphere without leaving raised collar or seam

AQUARIUS C 25.07.79-BE-877880
(16.11.79) A23g

Lollipops are formed from a continuous strip of candy material on a rotating drum mounted on a horizontal shaft. The forms for the lollipops are distributed around the periphery of the drum, the raw material being pressed into the form and then stamped by two stamps capable of vertical movement only which move towards each other to stamp the raw material in the form to a sphere.

At the stamping station, sticks, fed from a magazine are inserted into the spheres by a pusher mechanism. After withdrawal of the stamps, the clearance between them is sufficiently great to allow the formed lollipops to fall away from the drum at the bottom of the rotation. The sticks are pref. inserted radially inwards and are held in position by a disc rotating with the drum with its plane vertical and with the grooves for the sticks lying along radii.

The mechanism is subjected to less wear than the traditional machines for forming lollipops and the lollipop itself does not have a raised collar or seam to interfere with its consumption. 25.7.79 as 877880 (18pp1370) (F1)

Machine for the continuous prodn. of potato chips and similar edible prods. consists of a punching station where chips are punched between upper and lower dies from an endless tape of rolled-out dough. An endless conveyor under the punching station carries pairs of moulds, each of saddle shape and with perforations. The lower mould receives the chip and the second mould, which is then moved over it, leaves a gap of ≤ 2 mm.

Machine is fully automatic and has a high output with a minimum of labour. 4.7.68 as 757986 (13pp39)

Cereal and seed grain modification - by absorbing synergetically acting mixt. of finely divided solids and oil vehicle

BARHAM H N 19.05.78-US-907834

C03 (22.11.79) A23b-09 A23l-01/10 A23p-01

Whole cereal- and seed grains are treated by contacting with a mixt. of a finely-divided solid material (I), an an oily vehicle (II), in which (I) and (II) act synergistically w.r.t. absorption of grains. Treatment is continued until the mixt. is absorbed by grains.

Process can be used to change nutrient content and/or encapsulate chemicals inside grain or seed tissue. Solids can be incorporated in whole seeds to increase nutrient value for foods and animal feeds and/or increase safety in handling grains. The grains can be treated whole. The mixts. are absorbed in <5 min. 18.5.79 as 920272 (41pp200)

CLER- ★ D13 86348B/48 ★FR 2417-260
Refrigerated reception and storage of milk - allows precooled chilled water to be diverted via storage tank base

CLEREN SA 17.02.78-FR-005263

Q75 (19.10.79) A23c-03/04 F25d-17/02

Appts. is of the type in which incoming milk is precooled on its way to a storage tank by passage through a heat exchanger. The heat exchanger uses, as a cooling medium, chilled water drawn from a refrigerated tank of iced water.

Improvement is that chilled water from the refrigerated tank can now be passed also through a heat exchanger in the base of the storage tank. The tank base heat exchanger pref. takes the form of flat coil similar to those used in evaporator plates of vapour compression refrigeration systems. The condenser of the ice tank refrigeration system is pref. used to heat up a supply of water for other purposes.

Used for cooling and storing milk collected directly from a milking installation, e.g. in a dairy farm.

Cooling is effected much more quickly in the heat exchanger than in the bulk storage tank. The cooling coil in the tank does not entail major structural arrangements for tanks of large capacity. 17.2.78 as 005263 (8pp448)

INRG ★ D13 86349B/48 ★FR 2417-263
Simultaneous extrn. of lipid and protein from oil seed - by boiling in water, adjusting pH, sepg. lipoprotein fraction and extracting lipid

INST NAT RECH AGRON 20.02.78-FR-004799

C03 (D23) (19.10.79) A23j-01/14 C11b-01/14

Lipids and proteins are extracted from oil seeds by (i) making proteins insol. and inactivating enzymes by boiling the milled seed with water, (ii) adjusting the pH of the suspension to 3.7-8.5, (iii) sepg. the lipoprotein fraction, and (iv) extracting the lipids from the lipoprotein and isolating lipid and protein. Suitable oil seeds include oil-rich seeds such as arachis, sunflower, rape, copra, palm and cotton, esp. rape which is normally unsuitable for cattle cakes because of its high content of cellulose and toxins.

The process avoids preliminary defatting of the seeds and gives substantially pure protein and food-grade lipids suitable for man or animals. 20.2.78 as 004799 (20pp288)

LLEG- ★ D13 86355B/48 ★FR 2417-345
Spray tunnel washing screens for draining cheese curds etc. - has conveyor which automatically grips and releases each screen

LLEGOMAT 15.02.78-FR-004672

P13 P43 (19.10.79) A01j-25/11 B08b-03/02

Washing machine of the type comprising a horizontal tun-

nel through which items to be washed are conveyed. Inside the tunnel the items are sprayed with washing liq. which drains to a tank below the tunnel to be recycled.

The conveyor is of the overhead type passing longitudinally along the top of the tunnel. From the conveyor are suspended spaced carriers to which the items can be temporarily attached to be transported through the tunnel. Attachment is by means of a spring gap dog which automatically holds the item as it is inserted. Release of the dog is automatic at the discharge end of the tunnel.

Used for washing, cleaning and sterilising equipment for re-use in food factories, in partic. washing curds draining screens used in the mfr. of cheese. Very thorough cleaning is achieved without manual labour. As complete mechanisation for washing curds draining screens, etc., the machine can be installed in a continuous prodn. line. 15.2.78 as 004672 (15pp448)

MILE D13 29162Y/17 =NL-161-980
Glycinamide salt food seasoning compsns. - esp. with sodium
glutamate, inosinate or guanylate, as salt replacement
MILES LABORATORIES INC 18.10.76-US-733156
E16 (15.11.79) *BE-849-487 A23l-01/23

Food is given a salty taste without using NaCl by adding
a glycinamide salt (I), esp. glycinamide hydrochloride (II).
The (I) is pref. used in conjunction with one or more flav-
our builders such as monosodium glutamate (III); sodium
5'-inosinate (IV) or sodium 5'-guanylate (V). A pref. seas-
oning agent is a mixt. of 20-91 wt. % (I) and 9-80 wt. %
flavour builder, adding at 0.1-4.0 wt. % on the food in place
of NaCl.

In an example, hamburgers were seasoned with 0.8 wt. % of a mixt. of 86 wt. % (I) and 14 wt. % of equal parts of (IV) and (V). 14.12.76 as 013871 (5pp513)

KONN D13 90985X/49 = NL-162-136
Antibiotic dihydromocimycin and its salts - for control of treponema dysentery in pigs and intermediate by oxidn., for mocimycin (BE161176)

GIST-BROCADES NV 22.07.75-GB-030646 (16.05.75-GB-020926)
B03 C02 (15.11.79) *DT2621-615 A61k-31/43 C12d-09/14

An antibiotic dihydromocimycine (I) is prep'd. by culturing a species *Streptomyces ramocissimus* in suitable conditions and isolating (I) from the fermented culture. *S. ramocissimus* produces known mocimycine as well as (I). (I) has a greater activity against many micro-organisms than mocimycine and may be used as an antibiotic in human and veterinary medicine. (I) is very active against the cause of *Treponema dysentery* or *Vibrio Doyle* in pigs and is more active against this than known tylosine. The ratio between mocimycine and (I) increases in favour of (I) by aerating the medium with oxygen.

The culture medium contains customary C- and N-sources as well as P, Ca, Fe, S, Mg, K, vitamins and trace-elements. Temp. is e.g. 26-34°C at pH 5-9; aeration pref. at 1-3 l air/min/2 l medium. Small concentrations of Fe, Co and Ni increase the yield of (I). 13.5.76 as 005093 (12pp279)

KONN D13 87202V/51 = NL-162-138
Antibiotic residues determination in milk and meat - using solid agar-agar inoculated with sensitive microorganism spores

GIST-BROCADES NV 31.05.73-GB-025947

B04 R16 (D12) (15.11.79) *BE-815-759 C12k-01/06 G01n-33/02

Method is described for indicating the presence or absence of antibiotic residues in fluids of animal origin. Spores of antibiotic-sensitive microorganism in an agar medium are placed in transparent containers, so that they can not germinate because of a deficient nutrient. The medium is so heavily inoculated, that after addn. of sufficient nutrient and incubation of optimal temp, growth is perceptible within 4 hrs. The medium is allowed to solidify with the meniscus perpendicular to the side wall.

The containers used are tubes with i.d. of 3-20 mm. Nutrients in storable form and the sample, are added to the medium and incubated at optimal temp. The presence or absence of antibiotic residues is indicated by the growth or growth inhibition observed, using an indicator added either to the nutrient or to the medium.

Pref. the nutrient is in the form of tablets, coated with a layer which inhibits passage of moisture from the medium into the tablet at normal temp., but permits passage of nutrients during the determination. 30.5.74 as 007251 (7pp913)

Continuous solid-liq. extrn., esp. of vegetable material - using series agitated reactors contg. mesh sepg. element
NAMPROGETTI SPA 24.05.78-IT-023720
P01 (D23) (23.11.79) B01d

The process consists in treating a solid substance with a solvent (mixt.) in a number of reactors in series, each provided with means of agitation. The substance is introduced into each reactor along with a current of solvent, after solid sepn., it is passed to the next reactor. After the last reactor, the entrained solids are sepd. from the solvent by filtration. The process is carried out in apparatuses having a sepn. element of variable geometric form in a mesh opening of 1-200 μ .

The process is esp. applied to vegetable materials, partic. to the de-fatting of oil contg. seeds. It is continuous and gives a very efficient extraction. 23.5.79 as 517 (24pp597).

Fryer for cooking in oil - has cover with fume and oil filter capable of holding all oil
POWENTA-WERKE GMBH 28.08.78-DT-U25499
P01 P28 (16.11.79) A47j B01d

The top of the domed cover of a vessel for cooking and frying with oil has a seat provided with means of introducing a fume filter and/or a decantation filter for fat, which can be detached from their fastenings.

The capacity of the conical cover is at least equal to the volume of oil used in the vessel. The seat is formed as a ring fixed to the cover, and inside the cover there is a collar on which the fume filter rests during cooking. The filter for the fat is a gauze fixed to the seat and during cooking it is below the fume filter.

To filter the oil after use it is only necessary to invert the cover above a suitable container and pour the oil into the cover. The operation is perfectly simple and there is no risk whatever to the user. 31.7.79 as 877998 (7pp1014)

Butter and cheese block mincing machine - steps horizontal block through vertical screw at right angles, travelling downwards
ROD FINDUS SA 08.05.78-CH-004990
P41 P62 (28.11.79) B02c-18/26 B02c-19/20 B26d-01/36
E: E(BE, DT, FR, GB, IT, NL).

The mincing machine has a frame with a horizontal part and horizontal guides (4) between which the block of food substance (3) is fed towards the cutter (9). This cutter is a horizontal screw at right angles to the direction of advance of the block.

This screw is positioned inside a vertical frame part with the control panel (18) on top with the drive motor (1) behind it. This drive motor is preferably pneumatic, but under suitable conditions could be electric or hydraulic. The screw is raised and lowered against the face of the block as it rotates to make its cut.

The machine may be used for mincing large blocks of compressed meat for mass production of food portions in a preparation plant, but more particularly for mincing blocks of cheese, for the manufacture of pizzas (21).

The design of the cutter ensures an even spread of minuted cheese over the surface of each pizza. The tendency of cheese to stick to the cutter is avoided, and the cutter suits a variety of meat products.

Anaerobic effluent treatment tank with reaction and settlement zones - has easily removed dividing walls which prevent gas from entering the settlement zone

CENTRALE SUIKER MIJ NV 23.05.78-NL-005584
(23.11.79) C02c

Effluent is treated anaerobically in a biological treatment tank divided into a common reaction compartment and a

series of settlement compartments each of these having opening at their lowest points through which the sludge may sink back into the reaction compartment. The settlement compartments are divided from the reaction compartment by means of inclined walls which feed together to the lower opening. One of the walls in each compartment is a continuous wall whilst the other is in two parts. The upper part terminates at a point some distance between the top and bottom of the compartment and is continued the form of a second wall parallel to the first but set back from it. The lower edge of this continuation extends beyond the lower edge of the opposite wall to prevent the ingress of gas from the reaction compartment into the settlement compartment. The suspended sludge passes into the settlement compartment via the upper gap between the two parallel walls, the overlap again preventing the ingress of gas which continues to climb to the collection zone.

The construction is simple and economic whilst ensuring that no gas enters the settlement zone and that settled sludge passes rapidly through the reaction zone with a minimum of horizontal movement. 23.5.79 as 876511 (14pp1370) (F1).

CNSM ★ D15 85963B/48 ★ BE-876-511
Supply system for anaerobic biological treatment tank - ensures thorough mixing of inflow with active sludge particles with breakdown of the suspended particles

CENTRALE SUIKER MIJ NV 23.05.78-NL-005585
(23.11.79) C02c

The influent into an anaerobic biological treatment tank is introduced via a number of different inlets distributed across the horizontal cross-section of the tank. In order to create the greatest degree of mixing and eliminate possibility of short circuiting and dead zones, the indi-

l discharges supply intermittently so that, for a short time at each discharge, there is a high flow creating turbulent turbulence.

Pref. arrangement for achieving this mode of operation comprises a main supply system with a number of discharge openings into the tank, each opening having its own valve automatically operated by a time switch and sequencing control. The circulation is further improved by mounting the discharges on a rotating supply device. The supply arrangement ensures a thorough mixing of the influent with the active sludge without the risk, inherent in mechanical agitation, of breaking the suspended particles down so that they are then carried through the system with the cleared effluent. 23.5.79 as 876512 (10pp)

Water carbonator for making sparkling drinks at home - using pressure of carbonating gas to hold bung in neck of drinks bottle
THORN SVENSKA AB 02.08.78-SW-008346
(16.11.79) C02d

The carbonator comprises a rigid casing which houses a cylinder containing CO₂ under pressure. A bottle holding water to be carbonated is also housed in the casing. A hand operated valve passes gas from the cylinder via a nozzle pipe passed through a bung in the neck of the bottle. A over-pressure relief valve communicates with the interior of the bottle during carbonation.

The novelty is that the top of the bung is connected to a flexible diaphragm which has a top surface of greater area than the projected area of the bung facing the interior of the bottle. The top of the diaphragm is in a sealed chamber which communicates with the interior of the bottle during carbonation. This means that closure force exerted by gas pressure on the diaphragm always exceeds the force of gas pressure tending to expell the bung from the bottle. The relief valve communicates with the chamber containing the top of the diaphragm.

Provides simplicity of operation and economy of mfr. The bung is always held safely in place by pressure of the carbonating gas, obviating the need for elaborate clamping devices. 31.7.79 as 878003 (16pp448).

Nitrogen-rich solids recovery from dairy waste waters - by passing through filter medium under conditions for growing *Geotrichum candidum* and/or *Fusarium tabacinum*

IMPERIAL CHEM INDS LTD 19.05.78-GB-020724

C03 (C04 D13) (22.11.79) C12d-13/06

Parent patent discloses the recovery of N-rich solids by passing a protein-rich waste water, from milk or dairy prod. processing, through a synthetic filter medium. Waste water pH is set to 3-6, so that fungi having a high N-content are pref. grown on the wetted surfaces inside the filter medium. The N-rich solids leaving the filter medium are then sep'd., and recovered. In this addn., the fungus culture contains *Geotrichum Candidum*, (I) and/or *Fusarium tabacinum* (II).

The dried solids can be used as animal feedstuff additives, soil conditioners or fertilisers. The N-content of the dried solids is increased from e.g. 2 wt. % to < 55wt. % The dried wt. of the solids make up < 50wt. % of BOD rem-

ved through filter. 16.5.79 as 919801 Add to 2414555 (3pp200)

Pyrogen removal from aq. solns. - by passing through package contg. polymeric anisotropic ultrafiltration membranes in skin-to-skin contact

MILLIPORE CORP 18.05.78-US-906922
A88 B06 J01 (22.11.79) B01d-13 B01d-31 C02b-03/02
Pyrogens including their aggregates or mycella, are removed from flowing aq. solns. by passing through a device contg. ≥ 2 consecutively arranged anisotropic ultrafiltration membranes having nominal mol. wt. limits below the mol. wt. of the pyrogens to be removed. Novelty consists in arranging ≥ 1 membrane next to ≥ 1 further membrane, so that the whole skin surface of one membrane is in close contact with the whole skin surface of the other membrane, and the edges of one membrane are sealed with the corresponding edges of the other membrane.

5 Orders of magnitude of pyrogen are retained, i.e. 99.999%, allowing for the prepn. of water for injection. The ultrafiltration membranes used may contain pin-holes, cracks, and other small defects. Any membranes consisting of film-forming polymer may be used. 18.5.79 as 920253 (52pp200)

Skinless hydrophilic alcohol insoluble polyamide membrane - forming tubular filter element delivering bacterially sterile effluent
PALL CORP 15.05.78-US-905698

A23 J01 (A88) (28.11.79) B01d-13/04 C08j-05/18 C08l-77
D/S: E(BE, CH, DT, FR, GB, IT, NL, SW).

(A) Prepn. of a skinless hydrophilic, alcohol-insoluble polyamide membrane comprises (a) forming a soln. of the polyamide in a solvent and inducing nucleation of the soln. by controlled addition to the soln. of a non-solvent for the polyamide under controlled conditions of concn., temp., addition rate and degree of agitation to ppte. the resin particles and form a casting soln., (b) spreading the soln. on a substrate to form a thin film, (c) contacting and diluting the film with a non-solvent to ppte. the resin as a thin skinless membrane and (d) washing the membrane to remove solvent and drying. Prepn. of multilayer skinless membranes is also claimed.

(B) A filter element comprises the polyamide membrane, pref. corrugated in a tubular configuration, with the tube ends sealed to end caps having a central aperture. The seals are fluid tight and the membrane sides are lapped and sealed together.

(C) Process for rating the effectiveness of a resin membrane as a filter in terms of removal of a contaminant correlates such removal with air flow measurements through the wetted membrane and the membrane thickness as a function of pore size. Pref. contaminant is a suspension of *Pseudomonas diminutiae*, the ability of the membrane to deliver bacterially sterile effluent being determined.

The membranes have high flexibility and can be folded back and forth without damage and without addition of plasticiser. They also have useful pressure drop characteristics. The membranes are wetted through by water in > 1 s. and have absolute particle removal ratings of 0.10-5 μ M.

Aerobic sewage treatment - in tank with revolving emerging hollow elements of specified shape

STAHLER T 22.05.78-DT-822347
(28.11.79) C02c-01/10

D/S: E(BE, CH, DT, FR, GB, LU, NL, OE, SW).

A device for the biological decomposition and aeration of sewage and sludge, esp. with a faecal content, is a horizontal semicylindrical tank with several sets of hollow elements attached to a revolving shaft by arms. When the arms are in the horizontal position, the hollow elements (pref. round or rectangular shape) have side walls but are open on top and bottom, with a partition in the

middle. Within the top 90° of one complete revolution, the hollow elements emerge from the fluid into the open air.

This design ensures that sludge cannot remain lodged in the hollow elements and undergo an anaerobic fermentation. There is a constant renewal of the air in the hollow elements to contact the mat of biogenic matter in them.

Electrolytic removal of metal ions using fluidised bed - of cathode particles and partial recirculation of soln. contg. ions

AKZO NV 24.05.78-NL-005607

M28 (28.11.79) C02c-05/12 C25c-07

D/S: E(BE, DT, FR, GB, NL, SW).

An electrochemical cell is used to electrolytically remove metal ions from a soln. which is passed upwards through a bed of particles acting as cathodes in the cathode compartment of the cell. The soln. leaving the compartment is partially recirculated through the bed and partially discharged. A diaphragm separates anode and cathode compartments. The soln. in the cathode compartment and the recirculating soln. are screened off from the air in order to prevent them from absorbing oxygen.

Used for recovery of metals from solns. and removal of undesirable metals from waste water.

The appts. is compact and of simple construction with the separator and cathode compartment assembled to form a single unit. Several cells may be connected in series.

Flow distributor for fluid bed reactor - with fluid passing along paths with diverging walls to slow down flow

DORR OLIVER INC 24.05.78-US-909076

J04 (28.11.79) B01j-04 B01j-08/20 C02c-01/06

D/S: E(BE, CH, IT, NL, OE, SW).

A liquid stream passes from an inlet into a treatment tank via a flow distributor. The stream is introduced through ports which communicate with walled divergent flow paths of increasing cross-sectional area with increasing distance from the ports. Thus the velocity of the liquid is uniformly diminished.

The divergent flow paths are oriented to direct the flow in the range from horizontal to vertically downwards in the tank. From the divergent path the liquid passes to a flow diffuser which is oriented to direct the fluid flow vertically upwards in the tank to fluidize contained particulate solids.

The appts. is used in a fluid bed reactor e.g. those used to replace traditional biological reactors used in activated sludge or trickling filter processes for BOD removal, nitrification or denitrification.

The appts. produces a flow with minimum agitation so that abrasion and biological growth removal is also minimized.

Purificn. plant for waste water from small settlements - combines physical and biological treatment in reliable, inexpensive installation

LEROI G J 16.02.78-FR-004357

(19.10.79) C02c-01/02

A plant installation for the purificn. of waste water by a combination of physical and biological treatments.

The installation comprises three independent treatment chambers connected for series flow. The middle chamber is a biological reactor in which an electric motor is employed to transfer oxygen from the atmos. to the liq. The same motor is also used to circulate and to homogenise the liq.

The chamber upstream of the biological reactor is pref. adapted for flotation sepn. of incoming waste water. The final chamber downstream of the reactor is pref. a decanting digester.

The first of the chambers pref. takes the form of a septic tank which ensures liquefaction and homogenisation of the incoming waste prior to biological treatment. Overloading of the biological reactor is pref. prevented by inserting an orifice plate in the transfer pipe from the first chamber.

Used for the purificn. of waste water/sewage from single family dwellings, small settlements, housing estates, etc. 16.2.78 as 004357 (8pp448)

Prodn. of fresh water from sea water using solar heat - where collector is used having hydrophilic cotton and corrugated metal plate with light adsorbing film

SHIMODA H 10.04.78-JA-041965
(18.10.79) C02b-01/06

The solar heat collector comprises a heat retaining part, a hydrophilic cotton, and a corrugated metal plate having holes in the top of the wave. A desired amt. of sea water is intermittently or continuously supplied to the hydrophilic cotton to provide a wet cotton. The corrugated metal plate is provided with a sunlight adsorbing film on the front surface and a black-coloured plastic plate on the back surface.

When the sunlight is illuminated to this collector, the solar heat is conducted and radiated from the waved plate to the hydrophilic cotton and the wave spaces to generate a high temp. and much moisture air. The air is passed through the holes into the upper air chamber and cooled to adhere water drops to a glass surface because the heat escapes through the glass.

Soft water may be easily produced from the sea water or hard water in the solar heat collector. The sunlight adsorbing surface and the black-coloured surface are not contacted directly with the sea water and the collector is of a panel construction to be used as roof members. 10.4.78 as 041965(2pp35)

Organic waste treatment, e.g. for sewage sludge, night soil etc. - comprises treatment with microorganisms to decompose the cpds., then decomposition to methane using anaerobic fungus

HITACHI PLANT ENG CONST 13.04.78-JA-043957

(24.10.79) C02c-01/02 C02c-03

Organic wastes e.g. sludges from sewage treatment plants, night soil, domestic animal droppings, urban refuse etc., are treated by using microorganisms such as facultative anaerobe, fungi, etc. The organics such as celluloses, proteins, etc., are initially decomposed by the addition of a high molecular cpd. -decomposing enzyme, e.g., cellulase, proteinase, e.g., at pH 4.5 to 6.5 and at 30 to 60°C to form low molecular cpds., e.g. organic acids, alcohols, etc. The slurry from the first process is then treated by means of an obligatory anaerobic fungus at pH 6.5 to 8.5 and at 30 to 60°C in order to decompose the low molecular cpds. into methane gas, etc.

The efficiency of the acid formation reaction and the decomposition reaction is increased. The amount of methane gas generated is increased and excess energy is produced, other than energy required with a compact appts. at lower cost. 13.4.78 as 043957 (3pp117)

KURK ★ D15 86962B/48 ★ J5 4136-749
Decolouration of and organics removal from waste water - by denitrification, and contact with catalyst comprising e.g. alumina support contacted with cobalt and/or nickel ions, and a chlorine cpd.

KURITA WATER IND KK 17.04.78-JA-044292

(24.10.79) C02c-05/04

The process for treating e.g., sewage, night soil treated waste water, etc. comprises initially subjecting the waste to a denitrification treatment, and then contacting the waste water with a catalyst. The catalyst prepared by contacting a support, e.g. zeolite or alumina, with cobalt and/or nickel ions, washing it with water, and then contacting it with a chlorine cpd. e.g., sodium hypochlorite, etc., including chlorine gas, in the presence of a chlorine cpd., e.g. sodium hypochlorite, etc. including chlorine gas.

The process consists of a simplified chlorine cpd. charging device and a catalytic reaction tank, and organics present in waste water can be removed and the organic waste water is effectively decolourised. The operation is simple and the time required is short. Valuable materials such as nickel and/or cobalt are not released. 17.4.78 as 044292 (5pp117)

EBAI ★ D15 86963B/48 ★ J5 4136-750
Treating night-soil polluted water - by biological digestion and denitrification, in presence of lime to maintain neutral to alkaline pH

EBARA INFILCO KK 15.04.78-JA-044661

(24.10.79) C02c-01/02

An appropriate amt. of lime, e.g., quick lime, slaked lime, etc., is added to waste water in the digestion process so that the pH of waste water in the digestion process can be kept at pH 6.0 to 9.5, pref. 7.5 to 8.8. The lime used also includes blast furnace slag, ashes discharged from the incineration of excess activated sludge.

Troubles with the use of $\text{Ca}(\text{OH})_2$, CaO , etc., as neutralisers can be eliminated by removing alkaline components originated from NH_3 and also digestion can be performed rapidly and economically by a synergistic effect of lime added and microorganisms taking part in the biological treatment. In addition, colouring matters and other organics can be removed in a wide range with simplified operation in the activated sludge treatment system without the installation of specific colouring matters-removing appts. 15.4.78 as 044661 (5pp117)

 Metal-chelating resins contg. imino-diacetate gps. - are
 regenerated by washing resin with acid, water, alkali and water
 respectively
 HITACHI KK 01.04.74-JA-035675
 A91 (02.11.79) *J50129-489 + B01j-01/09 C09k-03
 Metal-chelating resins having iminodiacetate gps. are re-
 generated after treatment of metal-contg. industrial waste
 waters by washing the spent resins with acid, water, alkali
 and water in that order until the vol. of the resin after
 each wash was 50-5, 40-5, 70-5, and 95-100% respectively
 of the vol. of resin prior to metal adsorption. The resins
 are effectively regenerated by the swelling and shrinking of
 the resins during the acid, alkali, or water washings.
 In an example, a iminodiacetate-contg. resin after
 treatment of waste water contg. Cu was regenerated accor-
 ding to the above processes using 1N HCl and NaOH solns.
 and water. The Cu-chelating capacity of the regenerated
 resin was similar to that of new resin. The Cu-chelating
 capacity was markedly decreased if the water washing
 steps were omitted. The regeneration efficiency was not
 affected by the concn. of acid or alkali used, but was affec-
 ted by changes in vol. of the resins during washing. 1.4.74

IIDA T 19.10.76-JA-124393
(07.11.79) *J53050-061 B01d-03 C02b-01/04

Appts. is claimed for producing pure water from the sea and dirty waters, utilising solar energy collected by heat collectors, each connected to a distillation cpd., thus forming distillation stages, which are connected in series. Steam generated in the distillation is heat-exchanged with sea water in heat exchangers. Ejectors are provided to reduce the pressures in the distillation appts. to drain the pure water.

Arrangement is designed to evaporate the sea water at higher temps. of 55-75°C repeatedly and to maintain the evapn. rates in the individual stages, independently of the concn. of the sea water content. Novelty is that each distillation appts. operates under a reduced pressure by the ejector driven by power generated by a steam turbine driven by a steam superheated by the solar energy. 19.10.76 as 124393 C02b-1/04, B01d-3/00 (7.11.79) IIDA, T (7pp) (J5 3050061)

An aeration basin for effluent is equipped with a rotor mounted in the centre of the basin on a vertical rotating shaft to which a number of paddles are attached which are immersed in the basin.

This conventional arrangement is modified and incorporates a sepg. wall which has the effect of making the rotor also serve as a conveyor. This enables a horizontal circulation to be induced in a suitably shaped basin, thus improving the distribution of the air or oxygen in the effluent. 9.2.73 as 001853 Div. ex. 6.8.63-296294 (4pp1370)

RUTT- D15 46342Y/26 = NL-162
Dewatering of settled effluent sludge - by spraying it into the air to produce extended surface area for drying
RUTTE JB BV 10.12.75-NL-014425
(15.11.79) *NL7514-425 C02c-03

Effluent sludge is dried by spraying a thin layer of it on to the surface of the terrain, waiting until this layer has reached the required degree and then spraying another thin layer on top of the first. This process is repeated until the depth of the dried material is sufficient for it to be transported to the next treating stage.

The spraying brings the material into intimate contact with the air and the thin layer also has a high surface area to vol. ratio, further helping the drying process. The tendency to build a shallow crust of dried material over the top of the still damp material is also avoided by this means. The net result is a faster drying rate than is achieved for a given mass of material over the same area by the traditional method. 10.12.75 as 014425 (4pp1370)

Removal of heavy metal ions from acidic waste streams - includes treatment with iron oxide dust from cast iron or steel mfr. to by/pass neutralisation stage
CHELYABINSK POLY 11.05.77-SU-483315
J01 M14 (18.03.79) C02c-05/02

Heavy metal ions are removed from acid waste streams from e.g., etching processes, electroplating processes, acidic mine-working effluents, open cast copper mine-working etc., by treating with Fe oxide dust obtd. from dedusting systems in cast iron and steel mfr.

A typical dosage is 1-1.5g of Fe oxide powder per mg. of metal ion. The purified water may then be recovered by settling etc.

Dividing stream of eluate from chromatographic column - and applying to absorbent material on drum for UV VIS coordination
ELI LILLY & CO 28.12.77-US-865278
(20.11.79) C12k-01/04

The eluate from a chromatographic column is divided into two streams each regulated by metering valves. One stream passes to waste while the other is split into typically four substreams. The substreams are discharged onto absorbent material carried by a rotating drum to form parallel strips on the drum.

The solvent is then evaporated from the absorbent material which is subsequently divided into strips. Each strip is contacted with a bioautograph medium contg. one desired test organism. After the strips have been incubated the test results are correlated with the UV/VIS absorbency values.

The appts. tests antimicrobial activity of an eluate with test organisms. The appts. forms simultaneously four strips of eluate in absorbent material and coordinates UV/VIS absorbency values. 28.12.77. as 865278 (9pp295)

Redn. of available chlorine content of waste streams - from hypochlorite prodn., by treatment with chlorine under controlled conditions
OLIN CORP 21.07.78-US-926771
E34 (E33) (20.11.79) C02b-01/36
The available chlorine content of effluent from a plant

producing alkali(ne earth) hypochlorite is reduced by chlorinating the soln. at 80-100°C and pH 5.5-8.5 so that a major portion of the available chlorine is converted to chlorate.

The effluent can then be fed to a water purification process using a carbon bed. The process is economical and can treat streams with a high available chlorine content.

The waste stream is esp. that produced in $\text{Ca}(\text{OCl})_2$ mfr. Pref. the temp. is 90-95°C, and pH 6.5-7.0. 21.7.78. as 926771 (4pp955)

CONO ★ D15 87477B/48 ★ US 4175-040
Centrifugal water oil separator - has coaxial nested bowls, where the inner bowl is rotatable and outer bowl is fixed
CONTINENTAL OIL CO 28.08.78-US-937391
J01 P41 (20.11.79) B04b-01/12

Oil is recovered from an oil/water mixt. using an appts. which includes two nested bowls, the outer one being stationary and the inner one rotatable. The inner bowl has a flange around its upper periphery covering a portion of the bowl interior. Each bowl is penetrated by a shaft which is rigidly affixed to the inner bowl but slidably passes through the outer bowl via a seal to prevent liquid passage.

The lower end of the shaft is connected to a motor and its upper end is rigidly secured to a perforated basket. The inner bowl has apertures near its lower end and near its periphery. A channel is fixed to the outer bowl within the annulus between the two bowls. The bottom of this channel has a connection to outside the outer bowl. An aperture at the bottom of the outer bowl is connected to a fluid levelling device which balances inflow and outflow.

The appts. is used to separate and recover spilt oil from the surface of a water body. The apparatus can handle water with an oil content of 25 ppm to 50% by weight. 28.8.78. as 937391 (6pp295)

UNIC ★ D15 87478B/48 ★ US 4175-041
Trough for degassing floating sludge - with rotating shaft providing gentle agitation for gas release
UNION CARBIDE CORP 05.10.77-US-839559
(20.11.79) B01d-19/02

An appts. for degassing floating solids in a liq-solid settling chamber includes an open-topped trough positioned so that it is partially submerged in the liq. in the chamber. The top of a first side wall of the trough terminates below the liq. surface while the top of a second parallel wall is above the liquid level.

Liq. contg. the floating solids is flowed into the trough over the first wall. A rotatable shaft is mounted in the trough with its axis horizontal and parallel to the first and second walls. Radially extending non-helical blades are joined to the shaft along its length so that as the shaft rotates the blades gently agitate the liquid and solids in the enclosure for degassing it. Liq. contg. degassed solids is discharged from the trough back to the settling chamber.

The appts. is partic. used in the settling tank of a sewage plant. Degassing of the floating solids and then returning the solids to the settling chamber encourages them to settle to the bottom from where they are removed as a sludge. 5.10.77. as 839559 (11pp295)

Fibrinolytic enzyme urokinase lyophilisate stabilisation - with human serum albumin and a polar aminoacid esp. glutamic acid

SUMITOMO CHEMICAL KK 12.05.78-JA-056826

B04 (22.11.79) A61k-37/54

New lyophilised urokinase preparations contain (a) urokinase, (b) human serum albumin, and (c) at least one polar amino acid or salt thereof. Urokinase is used as a fibrinolytic agent in the treatment of thrombotic diseases.

A combination of human serum albumin (HSA) and a polar amino acid exerts a synergistic stabilising effect on urokinase. Formations in which the polar amino acid is glutamic acid show higher in vitro and in vivo thrombolytic activity than usual urokinase preparations.

Pref. polar amino acids or amino acid salts are glutamic acid and its sodium salt, threonine, arginine, arginine hydrochloride, histidine and histidine hydrochloride, glutamic acid being partic. pref. In pref. lyophilizates, the ratio of HSA to amino acid is 1:0.5 to 1:10, esp. 1:0.1 to 1:4 w/w, and the combination of HSA and polar amino acid pref. present in all amt. of 10-50 mg per 6000-60000 IU urokinase.

The lyophilizate is produced by lyophilization of an aq. soln. of urokinase, HSA and at least one polar amino acid or salt thereof. A soln. of urokinase 6000 IU/ml and HSA 10 mg/ml in 0.025 N phosphate buffer pH 7.0 was divided into 1 ml portions, and each portion was treated with an additive, then lyophilized in a vial. After storage for 1 month at 50°C, the residual urokinase activity of the lyophilizate was determined as a percentage of the original activity. 3.5.79 as 917899 (15pp280)

The mass growth of diploid cells is achieved by (i) introducing a diploid cell suspension and nutrient medium into a system of communicating chambers formed by flat troughs sealingly stacked with their bases parallel, while the bases are vertical, arrangements being provided to allow distribution of liq. through the system and to equalise air pressure in the system, (ii) orientating the system with the bases horizontal and effecting distribution of liq. and cells over the troughs and growth of the cells, and (iii) orientating the system with the bases vertical and recovering cells

and/or cell products.

The theoretical probability of cell transformation of mutation at places of different conditions is reduced, and the risk of biohazards is minimised. Increased sterility is made possible, and cell-receptive plastic material, e.g. polystyrene, on which the cells grow best may be used. 26.5.77 as 022288 (8pp990)

Penicillin V-acylase obtd. by bacterial cultivation - of e.g. strain NRRL 11240, useful in prodn. of e.g. 6-amino:penicillanic acid from penicillin V

NOVO INDUSTRIAS 18.04.79-GB-013384 (19.04.78-GB-015522)

B04 (28.11.78) C07d-499/10 C07d-501/04 C07g-07/02

A penicillin-V-acylase is produced by cultivation of the bacterial strain NRRL 11240 or of a strain having the general characteristics thereof, or variants or mutants of these which retain the ability to produce penicillin V-acylase. Also claimed is the use of the acylase to produce 6-APA from penicillin V, 7-ACA from V-ACA, or homologues of 6-APA or 7-ACA from homologues of penicillin V or V-ACA.

The acylase has a broad pH-activity range and can be produced in industrially viable yields. 18.4.79 as 013384 (6pp949)

Fixed microorganisms prodn. - by forming a gel contg. platinum loops of microbes and incubating in culture medium

TANABE SEIYAKU KK 07.04.78-JA-041471

A96 B04 (20.10.79) C07g-07/02 C12c-11 C12d-03/02 C12d-13 C12k-01

Method comprises forming a gel e.g. PVA, carrageenan which contains 0.01-10 platinum loop-ful of microbial body on 100g (wet wt.) of the gel, in the granules or the film having the dia. or the thickness 2mm-5cm pref. 2-5mm and incubating thus formed gel in a suitable culture medium at 25-40°C to form the living microbial body layer in the neighbourhood of the surface of the gel.

Very small amt. of the microbial body is used and the culturing process to obtain large amts. can be omitted. As the microbial body, a culture medium contg. the microbial body can be used as it is without sepg. the microbial body. The dense living microbial body layer is formed in the neighbourhood of the surface of the gel and the fixed microbe shows high catalytic activity. The living microbial body layer can be renewed by continuing the incubation of the gel in proper nutritive medium and the enzymic process can be practiced for long time stably while maintaining high catalytic activity. 7.4.78 as 041471 (9pp5)

Prodn. of clear bacterial body with high vitamin protein content - by culturing *Pseudomonas* SD-21 bacterium in medium contg. methanol as carbon source

SHOWA DENKO KK 10.04.78-JA-041305

B04 C03 (D13) (20.10.79) A23k-01 C12k-03

Process comprises culturing a bacterium *Pseudomonas* SD-21 in a culture medium contg. methanol as the major C source and sepg. the multiplied bacterial body. Pref. the culture is practiced at 15-40 (esp. 30-37)°C at pH 5.5-8. esp. 6.5-8.0. Pref. the methanol concn. in the culture medium is $\leq 3\%$ and during the culture methanol is added intermittently.

Clear bacterial body having high protein and vitamin content is prepd. using inexpensive and easily obtainable methanol as the major C source. Prod. can be used as nutritive feed, but also as material for extracting proteins, nucleic acids, vitamins, etc. 10.4.78 as 041305 (3pp)

SHOW ★ D16 86704B/48 ★J5 4135-29
Prepn. of bacterial body having high protein and vitamin contents by culturing bacterium *Methylomonas* SD-12 using methanol as major carbon source

SHOWA DENKO KK 10.04.78-JA-041306

B04 C03 (D13) (20.10.79) A23k-01 C12k-03

The method is characterised by culturing a bacterium *Methylomonas* SD-12 (FERM P-4440) which can utilise methanol, in a culture medium contg. methanol as the major ca

on source and sepg. the multiplied bacterial body.

A clear bacterial body having high protein content and high vitamin content can be prepd. fermentatively by using expensive and easily obtainable methanol as the major carbon source. The bacterial body can be used not only as an excellent nutritive feed, but also as the material for extracting protein, nucleic acid, vitamin, etc.

The culture is practiced at 15-40°C (30-37°C) at pH 5-9.0 (6.5-8.5). The desirable methanol concn. in the culture medium is $\leq 3\%$ and, during the culture further methanol is added. 10.4.78 as 041306(4pp5)

OF ★ D16 86705B/48 ★ J5 4135-298
Additive for fermentative prodn. of glutamic acid - which both suppresses action of excess biotin, and acts as antifoaming agent
NIPPON OILS & FATS KK 07.04.78-JA-040184
A97 B05 E16 (A25 E17) (20.10.79) C09k-03 C12b-01/18 C12d-13/06

Antifoaming and productivity-improving agent for glutamic acid fermentation use contains a cpd. $\text{RO}(\text{C}_3\text{H}_6\text{O})_m(\text{C}_2\text{H}_4\text{O})_n$ (I) or (II) as the major ingredient.

$\text{O}(\text{C}_3\text{H}_6\text{O})_m(\text{C}_2\text{H}_4\text{O})_n\text{X}$ (II)
 $\text{O}(\text{C}_3\text{H}_6\text{O})_m(\text{C}_2\text{H}_4\text{O})_n\text{X}$
R is 1-24C alkyl or alkenyl or alkenyl. R' is 1-24C alkylene. X is H or 14-18 C satd. fatty acid. The esterification degree of the (I) and (II) is $\geq 60\%$, $m = n$

n is 10-80; n is 0-15. The mol. wt. of the ethyleneoxide chain is ≤ 20 w/w% of the whole cpd.

The agent is effective both for suppressing the action of excessive biotin and for defoaming. The agent is effective when using as little as 50-1000 ppm. and the amt. of the additives can be decreased. Further by adding the agent once at the beginning of the fermentation its productivity-improving activity and defoaming activity endure for whole fermentation period. 7.4.78 as 040184(5pp5)

AJIN ★ D16 86706B/48 ★ J5 4135-299
D-Arabitol prepn. - by culturing *Pichia* yeast strain modified to utilise hydrocarbon cpds.

AJINOMOTO KK 12.04.78-JA-042779
B05 E17 H04 (D13) (20.10.79) C12d-13

The method comprises culturing the yeast strain which belongs to *Pichia* and can utilise hydrocarbon, in a culture medium contg. hydrocarbon as the major carbon source and recovering D-arabinitol - accumulated in the culture medium.

The variety *Pichia oomeri* M₃-2 AJ 14589(FERM-p4463) has strong hydrocarbon, utilising activity without less of the producibility for D-arabinitol. It is obtd. by treating the parent strain which produces D-arabinitol but has little ability to utilise hydrocarbons, with N-methyl-N'-nitro-N-nitrosoguanidine. The parent strain is *Pichia oomeri* No. 230(FERM-P 158). D-arabinitol is a sweet sugar alcohol and can be used as sweetner, etc.

The culture is practiced aerobically at 20-40°C, pref. at 26-35°C at pH 3-7 for 1-10 days. After the culture yeast body is sepd. and the filtrate is demineralised with ion exchange resin. Then it is concn. at $\leq 50^\circ\text{C}$ to dryness and the residue is heat-dissolved in ethanol. The ethanol soln. is stood at ca. 5°C and crystalline D-arabinitol can be obtd. 12.4.78 as 042779(3pp5)

NISS ★ D16 86707B/48 ★ J5 4135-300
Geldanamycin and related antibiotics prodn. - by cultivating *Streptomyces hygroscopicus* B-434 under aerobic conditions
NISSHIN FLOUR MILL KK (TOBI-CHUG-) 07.04.78-JA-040229
B04 (20.10.79) C12d-09/14

Prodn. of geldanamycin and related antibiotics comprises cultivating *Streptomyces hygroscopicus* B-434 at 35-45°C in a nutrient medium under aerobic conditions and recovering from the cultured broth geldanamycin, 17-O-demethylgeldanamycin, 6-(3-methyl-2-butenyl)indole and enterocin. The antibiotics obtd. are active against gram-positive bacteria and mycobacteria. They are active also against tumour cells (antitumour). Thus, they are useful as antibiotics.

Streptomyces hygroscopicus B-434 (Ferm-P 3645) is used. It is cultivated in a nutrient medium contg. carbon sources (e.g. D-glucose, D-fructose, D-mannitol, D-

rhamnose, solubilised starch), nitrogen sources (e.g. soybean meal, meat extract, peptone, corn steep liquor, dried yeast) and minerals. The fermentation is performed at 35-45°C for 30-35 hrs. under aerobic conditions.

 Antibiotic A21a, prodn. antibacterial and animal growth promoter - by cultivating Streptomyces philipinensis strain under aerobic conditions

MERCK & CO INC 21.11.77-US-853078 (29.10.76-US-736794)
B03 C02 (20.11.79) C12d-09/14

Antibiotic A21A is produced by cultivating a strain of Streptomyces filipinensis, pref. NRRL 11,044, in a fermentation broth contg. assimilable sources of carbon (carbohydrates), nitrogen and inorganic salts under aerobic conditions. The antibiotics is pref. extracted from the broth using a water-immiscible polar or hydroxylic solvent, resp. chloroform, MEK or ethyl acetate.

A21A is a broad-spectrum antibacterial and is effective against e.g. Proteus mirabilis, Escherichia coli, Klebsiella pneumoniae, Pseudomonas aeruginosa, Serratia marcescens and mycoplasma gallisepticum. It is also useful as a growth-improvement agent for animals, being administered as a feed component or being dissolved or suspended in the drinking water. US4071631 claimed A21A and its salts and esters. 21.11.77. as 853078 Div. ex4071631 (9pp990)

Washing particulate feedstock esp. starch in hydrocyclones - arranged as multistage enclosed system with partial final stage recycling

WESSANEN (UK) LTD 24.05.78-GB-022187

P41 (28.11.79) B03b-05/34 C08b-31 C131-01

D/S: E(BE, CH, DT, FR, GB, IT, LU, NL, OE, SW).

In a multistage enclosed system for upgrading particulate feedstock, contaminating material is removed by wash liquid fed countercurrent to the feedstock. Pumps are positioned between stages and in the final stage a controlled portion of the underflow stream is returned to the inlet side of the pump which feeds this final stage.

The regulation of the amount of recycled liquid round the final stage is controlled by a calibrated orifice disc or a metering pump. Pref. all stages are operated under identical conditions and pref. include identical multi-hydrocyclones. Pref. the recycled portion is 15 to 40% of the vol. of the final stage underflow.

The appts. washes contaminating material from corn starch or potato starch. The recycling of the final stage creates in it working conditions similar to the other stages. This increases the removal of contaminants; reduces the amt. of wash water consumed; reduces the number of hydrocyclones needed in a stage, typically to 74; and reduces power consumption.

Shampoo compsn. - contg. anionic surfactant, polymer contg. quat. nitrogen, and lactate ester and/or cane sugar ester

LION FAT & OIL KK 12.04.78-JA-043045

A96 E19 (19.10.79) A61k-07/06 C11d-03/60

Shampoo contains anionic surfactant, polymer contg. quat. nitrogen and lactate ester and/or cane sugar ester as main components.

Compsn. imparts wiriness (sic) to hair and causes little irritation to the skin, and has prominent foaming power.

Anionic surfactant is ≥ 1 alkali metal salts of fatty acid (e.g., tallow acid, palm oil acid, higher side chain fatty acid) or alkanolamine salts of 3-molethoxysulphate ester of lauryl alcohol, 3-mol-ethoxysulphate ester of aliphatic alcohol of 11-15C prepd. by oxosynthesis, 1-mol-ethoxysulphate ester of aliphatic alcohol of 12-13C prepd. by oxosynthesis, sulphate ester of aliphatic alcohol of 12-13C, etc. are employed in amt. of 3-30 wt.%. Polymer contg. quat. nitrogen is ≥ 1 deriv. of cellulose ether contg. quat-nitrogen, deriv. of polytrialkylaminoethylmethacrylate contg. quat. nitrogen, polyvinyl-pyrrolidone, polyethyleneimine, etc. and are used in amt. of 0-1-5 wt.%. Lactate ester and/or cane sugar ester are used in amt. of 1-20 wt.% on the compsn. 12.4.78 as 043045(4pp170)

LIOY ★ D21 86602B/48 ★J5 4134-712
Shampoo compsn. - contg. anionic surfactant, phosphate ester surfactant and polymer contg. quat. nitrogen

LION FAT & OIL KK 12.04.78-JA-043046

A96 E19 (19.10.79) A61k-07/06 C11d-10/02

The shampoo contains an anionic surfactant, a phosphate ester surfactant and polymer contg. quat. nitrogen as the essential components. Compsn. stimulates the skin to a low degree and has prominent foaming power and high stability at low temp.

The anionic surfactant is pref. ≥ 1 of alkali metal salts of fatty acids (e.g., tallow fatty acid, palm oil fatty acid), alkanolamine salts of fatty acids, alkali metal-, al-

kaline earth metal- and alkanolamine salts of 3-mol-ethoxy-sulphate esters of 11-15C aliphatic alcohols and 1-mol-ethoxy-sulphate esters of 12-13C aliphatic alcohols and anionic surfactants obtd. by sulphonation and hydrolysis of a 12-14C alpha-olefin 12-16C vinylidene olefin and 12-16C inner olefin etc. Pref. content in the compsn. is 5-30 wt.%. The phosphate ester is pref. $R-O-(-C_2H_5O)_n-P(O)(OM)_2$ and/or $(R-O-(-C_2H_5O)_n)_2-P(O)(OM)$ (where R is unsatd. 10-20C hydrocarbon, M is alkali metal or alkanolamine, $n = 0-10$). Pref. content in the compsn. is 3-20 wt.%.
Polymer contg. quat. is pref. ≥ 1 of derivs. of cellulose ether contg. quat.-nitrogen (e.g., -JR-125, -JR-30M RTM, Union Carbide Co.), derivs. of poly(trialkylaminoethylmethacrylate) contg. quat.-nitrogen, polyvinylpyrrolidone, polyethyleneimine, etc. Pref. amt. in the compsn. is 0.1-5 wt.%. 12.4.78 as 043046(4pp170)

KANE ★ D21 86698B/48 ★J5 4135-1
Storage stable, non-toxic cosmetic compsn. - containing hydroxylamine cpd. having reduced stimulating effect on skin
KANEBO KK 08.04.78-JA-041428

 Shampoo compsn. contg. anionic surfactant and cellulose ether -
 surfactant being a condensed salt prepd. from higher fatty acid
 peptide
LION FAT & OIL KK 14.04.78-JA-043269
A96 E12 (E16) (22.10.79) A61k-07/06 C11d-01/10 C11d-03/37
C11d-10/02
 Shampoo compsn. contains 1-50 wt.% anionic surfactant
 formula (I) which is a condensed salt prepd. from high-
 fatty acid and peptide, and 0.05-5 wt.% cellulose ether
 wing a quat. N where 0.5-3.5 wt.% quat. N is contd.
 In (I) RCO is a higher fatty acid
 residue, R having 7-21 C atoms;
 R' is H, CH₃, or C₂H₅; and the
 part of the formula expressed by
 R'-(peptide)-COOM is an aminoacid, a mixt. of amin-
 acids, a peptide having ≤ 2000 molecular wt. or its sub-
 H. prod. with a N-lower alkyl gp.; M is alkali (earth)
 metal ion, ammonium ion, or ammonium ion substd. by
 3 organic gps.).
 Since a film forming cpd. salt is formed by the effect
 the anionic surfactant and cellulose ether contg. quat.
 which are essential components, uniform film is form-
 on the surface of hairs or skins of the head. Skin and
 hairs are prevented from chapping. Hairs feel soft and
 smooth after shampooing. Pref. surfactant is N-lauroyl
 sarcosinate. 14.4.78 as 043269(7pp126)

Oil well sulphate reducing bacteria inhibitor - contg. amino-paraffin hydrochloride obtd. by nitrating petroleum paraffin, hydrogenation and hydrochloric acid treatment

PETRO IND PROD TRAN 05.07.77-SU-505587

C03 E16 H01 Q49 (20.03.79) E21b-43

Aminoparaffin hydrochloride is of formula (I):-

treating with hydrochloric acid.:

The reagent acts on microorganisms which adapt to highly mineralised waters as pumped into oil formations. The reagent is more powerful than conventional sodium chloride so that less is required to obtain the same effect. The reagent prevents the formation or migration of hydrogen sulfide into the well product.

Lipovich, R.N., Asfandiyarov, F.A., Petrov, V.V. et al Bul. 10/15.3.79. 5.7.77. as 505587 (2pp26)

Sterilising reference electrodes - including treatment with soln. contg. hydroxyethyl methacrylate

UNIV OF UTAH 10.10.78-US-949573

J04 P34 R16 (20.11.79) A61I-01 G01n-27/30

A method is claimed for sterilising and charging a reference electrode which includes a tubular member open at one or both ends, one end being formed to function as a capillary, and contg. an electrode element. A soln. of a salt and hydroxyethylmethacrylate dissolved in an organic solvent is delivered into the tube, to surround the electrode, and the solvent is evaporated. The electrode is exposed to a sterilising gas. It is then aerated, and a second soln. of the salt is applied until the osmolality of the soln. within the tubular member and outside it is the same.

Cavities within the electrode are penetrated, and it is sterilised without damage to other parts of the measuring device. 10.10.78. as 949573 (4pp955)

Potassium iodide-silica gel reagent - for quantitative determ. of peroxide in oils and fats, useful for measuring degree of putrefaction

SUGIYAMA SANGYO KAG 10.04.78-JA-042323

J04 R16 (18.10.79) G01n-21/02

Reagent of potassium iodide-silica gel for quantitative analysis of peroxide cpd. in oils and fats with colorimetric method is claimed. A silica gel granular powder which is easily pptd. in a solvent is impregnated with KI and the impregnated powder is dried. The silica gel powder has a granular degree of 70-230 mesh and it is a conventional silica gel employable for column chromatography.

Typically, 100 g conventional silica gel having a granular degree of 70-230 mesh is dipped in 100 ml aq. soln. contg. 10% KI. The impregnated gel is filtered with Buchner's funnel, freeze dried and then dehydrated by heating it at 110°C. The reagent is mixed with an appropriate amt. of ethyl alcohol to separate out iodine by elution. Further, starch and the oils and fats contg. the peroxide cpd. are added to the ethyl alcohol contg. the reagent to give a bluish colour. The blue hue and degree of colouration correspond with the peroxide content. 10.4.78 as 042323(3pp15)

Stabilised liq. enzyme-contg. detergent compsn. contains (all by wt) (a) 20-90% H_2O , (b) a proteolytic enzyme (I), (c) 1-70% anionic and/or nonionic detergent (II), and (d) 0.1-30% of an H_2O -dispersible stabilising system for (I). Stabilising system consists of (i) an H_2O -dispersible antioxidant (III) having single electrode potential (at 25°C) for the oxidn. of (III) to an oxidised sp. (i.e. E_{ox}) not less than that of ascorbic acid but less than that of Na hydrosulphite and (ii) an organic, hydrophilic, H_2O -soluble polyol (IV) mol. wt. < 500 . Compsn. is stable to pH 5.2-9.0.

Incorporation of the stabilising system in the compsn. stabilises the enzyme activity of (I). Compns. are par

effective for removing proteinaceous soils from fabrics, meat, fat and blood. 22.5.79 as 017824 (19pp478)

Aminomethylene-di:phosphonic acid deriv. prepn. - by reacting an alkyl-orthoformate with an organic prim. or sec. amine and hydrolysing
NISSAN CHEM IND KK 11.04.78-JA-042349
C01 E11 (22.10.79) C07f-09/38

Prepn. of aminomethylenediphosphonic acid deriv. comprises reacting dialkyl phosphite of formula $(R'O)_2P(=O)H$ (where R' is lower alkyl), alkyl ortho-formate of formula $CH(OR)_3$ and organic prim. amine or organic sec. amine which has a b.pt. higher than that of the lower alcohol of formula ROH , and then hydrolysing the reaction prod.

Pref. dialkyl phosphite are, e.g. dimethyl phosphite, diethyl phosphite, dipropyl phosphite and pref. alkyl ortho-formates are, e.g. methyl, ethyl and propyl ortho-formates. Pref. organic amines are e.g. monoalkylamine, dialkylamine, dialkenylamine, piperidine, morpholine, quinopyridine, aminopyrazine, aminopyridazine, aniline, N-monoalkylaniline, N-monoalkylaminohetero cyclic cpd. The prod. is useful as chelating agent, detergent and herbicides. The method gives the prod. in high yield, and the reaction proceeds smoothly. 11.4.78 as 042349(4pp108)

A97 E19 (20.11.79) *DS2709-690 C11d-01/83 + C11d-03/06

Liq. cleanser compsns. for cleaning hard surfaces, contain an aq. soln. contg. 2-30 wt. % of a surfactant mixt. and 0-3 wt. % of a water-soluble salt of a 12-18C fatty acid, and having a pH of 7.0-10.5 as a 2% soln.

The surfactant mixt. comprises adducts of 3-30 mols. of ethylene oxide onto 10-20C aliphatic vicinal (1-4C) alkanediols or their monoalkyl ethers; and an anionic sulphonic cpd. contg. 8-20C linear alkylbenzene sulphonic acids, 8-20C linear alkane sulphonic acids or their water-soluble alkali(ne earth) metal or ammonium salt. The ratio of adduct to sulphonic cpd. in the surfactant is 1:1-20.

The cleanser prepd. readily removes dirt and grime from household appliances with enamelled metal walls with large surfaces, without scrubbing and without leaving streaks or spots on drying. 6.3.78. as 883685 (7pp931)

SHEL **D25** **38473A/22 = US 4175-0**
Refining surface active agent streams - contg. water and no surface active material, with sulphated or sulphonated organic material, by extn. with ketone or acetate as solvent

SHELL OIL CO 30.11.76-GB-049831

E19 (20.11.79) *BE-861-192 + C07c-141/04 C07c-143/02

Non-surfactant is recovered from an aq. based mixt. contg. water, surfactant organic salts comprising sulphated or sulphonated organic matter, and non-surfactant organic matter.

The mixt. is obtd. by the sulphation or sulphonation of 8-22C olefins, paraffins or alcohols to yield the corresponding monoalkyl sulphuric or sulphonic acid, followed by their neutralisation with a base to afford the corresp. surfactant organic salt. The aq. based mixt. is extracted with 6C ketone at $\leq 60^\circ\text{C}$ or a 1-6C alkyl acetate, to form a ketone- or alkyl acetate-based extract phase contg. all the non-surfactant, and a raffinate phase contg. water, some of the ketone or acetate solvent and all the sulph(on)ated matter.

The extract phase is then sepd. into a ketone or acetate fraction and a non-surfactant organic material fraction which is recycled to the sulph(on)ation reaction. 13.11.76 as 959958 (+30.11.78-US-856811) (4pp931)

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. In the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

Cutting food extrudate with upward cutting stroke - to allow cooling
of material through a surrounding vapour-permeable safety shroud
QUAKER OATS CO 31.10.75-US-627760
P71 (20.11.79) A22c-07 B30b-11/22

Food e.g. dough, is shaped by extrusion and the extruded
strand is cut into pieces such that the pieces are forced
forward upon exiting the extruder. Heat and steam is
dissipated from the extrudate at the cutting point. The cut
pieces fall gently onto a conveyor for transfer to a
packaging device. A vapour-permeable shroud surrounds
the cutting device.

The appts. dissipates steam build-up at prod. recovery
and minimises clumping and deformation of the prod.
The vapour permeable shroud provides protection to
machine operators as well as permitting the extrudate to
cool to a described stability. 16.9.76 as 261363 (15pp1044)

IMM/ ★ D11 87624B/49 ★ DL-137-397
Dosing and spreading viscous heterogeneous toppings and fillings -
at infinitely variable speed on bakery products vibrated afterwards
ZIMMER L 23.06.78-DL-206228
(05.09.79) A21c-05

Profiled cylinders are set up a forward in a heterogeneous
mass of paste to be dosed out as topping or filling for
pastries. As the flow passes through an adjustable open-
ing, it forms a viscous film which is made to flow unifor-
mly by being passed over a vibrator plate.

The plant is intended to dispense toppings and fillings
of different consistency and structure, so that there is
uniform covering without an auxiliary manual operation
being necessary. The work is mechanised and the quality
and the uniformity of the layering is improved. Damage
to stones in fruit is avoided as is also the soiling of the
end faces of the baking tins, by a brief interruption of
the flow. 23.6.78 as 206228 (6pp1045)

Automatic distribution appts. for cut lengths - partic. for moving
slices into ovens in perfect alignment
BONNAND/LORNAC 12.04.73-FR-013316
+Q35 (29.11.79) *BE-813-122 A21b-03/07 B65g-47/84 B65g-
59/12

The carriers extending along the mantle line of a transfer
cylinder for distributing stacks of slices of dough for bis-
uits singly onto a conveyor belt feeding an oven, are form-
ed by rectangular cutouts in the surface of the cylinder.
Each carrier projects to a distance less than the thickness
of the slices, and carries a single row of slices with it into
a slot between the cylinder and a sheet metal guide plate.
The plate is curved to suit the cylinder and is fixed at a
constant distance from it to allow the slices to pass through

The feed table to which the stacks of slices are trans-
ferred from a conveyor is inclined upwards towards the
cylinder, and is formed by a series of parallel, equally
spaced bars aligned in the same plane. A row of plungers
guided by cam tracks projects between the bars to move
the stacks of slices forward towards the transfer cylinder.
The arrangement works efficiently either continuously
or intermittently and delivers the slices to the baking oven
at high speed, perfectly flat and without crumb formation.
4.74 as 416624 (8pp1045)

BRIA D11 38210X/21 = DS 2451-326
Combined cutting and shaping machine for bakeries - compact
installation without pre-sheeters feeds laminates of single dough
sections

MASCH FAB BRIEM-HEN 29.10.74-DT-451326
(29.11.79) *DT2451-326 A21c-11

The two conveyors beneath the pair of feed cylinders in
each of the hoppers of a machine for the prodn. of strips
of dough with a laminator, for various kinds of bakery
prods., are extended outwards, beyond the pairs of cylin-
ders at each side, so as to be able to feed another belt at
each outer end.

The two conveyors are roller conveyors and means are
provided for reversing their direction of motion. The
plant with its two dough mixers, smoothing cylinders, cut-
ters, etc., is very compact and its cost of prodn. is red-
uced considerably. 29.10.74 as 451326 (6pp1045)

WERN ★ D11 87795B/49 ★ DT 2821-846
Dough mixing and kneading machine - has double arm tool inclined
at small angle to vertical
WERNER & PFLEIDERER 19.05.78-DT-821846
(29.11.79) A21c-01/04

The bowl of a dough mixing and kneading machine rotates
on a vertical axis and has inside it, a mixing and kneading
tool extending from above to the bottom of the bowl. The
axis on which the tool rotates is inclined and eccentric to
that of the bowl, and the enveloping surface of the tool
which has ≥ 1 arm is represented by a cylindrical rotary
body which is tangential to the wall of the bowl over the
whole height of the wall.

The axis of the tool is inclined at an angle of 15 - 30°
to the vertical. The tool is, moreover, in a vertical plane
which is spaced at a distance from the centre of the bowl
corresponding to 0.9 - 1.1 times the radius of the rotary
body representing the enveloping surface of the tool.

Used to improve the efficiency of machines with inclin-
ed mixing and kneading tools, so that dough of the same
good quality is produced from mixts. of very different ch-
aracter, irrespective of whether the capacity of the bowl
is used partly or to the full. The machine is of simple de-
sign and easy to handle. 19.5.78 as 821846 (17pp1045).

FABR/ ★ D11 87998B/49 ★ FR 2417-945
Bakery dough moulder for cylindrical stick loaves - uses opposed
belt elongators for improved form and texture of prod.
FABRE H S 23.02.78-FR-005473 (05.06.75-FR-017992)
(26.10.79) A21c-03

A bakery machine for moulding dough pieces into elong-
ated sticks via rollers, rolling belt and extending belt with
reaction plate. An intermediate proving conveyor gives
supplementary expansion of the dough to permit maximum
elongation without tearing. The elongated sticks are cut in
to short loaves by a rotary disc cutter.

In this addn, elongation of the dough is effected betwe-
en pairs of belts rather than belt opposed by reaction plate

The pairs of belts provide additional rolling of the
dough upon itself so that the cylindrical form of the stick
and the texture of the prod. are improved. 23.2.78 as
005473 Add to 5.6.75-017992 (7pp448)

EQUI- D11 45908A/26 = GB 1557-025
Continuous oven for baking bread - has rotary beds vertically
spaced coaxially to fit in confined spaces
EQUIPOS IND LLOYD 21.02.77-ES-456397
Q77 (05.12.79) *BE-864-145 A21b-01/42

A continuous oven has a circular baking chamber contg. a
firebox at the bottom, and a rotary soleplate between two
heat-radiating chambers each having its own heat control.

The oven pref. has ≥ 2 baking chambers, each operable
separately. Each baking chamber is pref. inclined at 6°

to the horizontal, with an access door at the lowest part. The soleplate is pref. of a refractory material.

Uniform cooling of different batches is assured. Used esp. for baking bread. 8.2.78 as 005086 (5pp1376)

SPIIL-★ D11 88136B/49 ★GB 2021-792
Removing dough from hopper and dividing into pieces - with weighing of hopper periodically to adjust action of divider
SPILLERS LTD 08.06.79-GB-019957 (10.03.78-GB-009503)
R13 R26 (05.12.79) G01g-19 G05b-11/*

Bread in a hopper supplies a divider positioned beneath the hopper and forming individual dough pieces. The hopper is mounted on weighing cells and after a predetermined number of cycles of the divider e.g. 32, the hopper weight is measured. From these measurements the quantity of dough used is calculated and compared with a target value. The error signal is used to adjust the divider to alter the size of the dough pieces. Pref. a gate can be slid across the hopper discharge during weighing to isolate the dough from the hopper. 8.6.79 as 019957 (20pp295)

ASAE ★ D11 88496B/49 ★J5 4139-612
Prepn. of fluid fat used in cakes - by adding glycol mono:stearate(s) and soybean lecithin to vegetable fat and heating repeatedly
ASAHI DENKA KOGYO 21.04.78-JA-048288
(30.10.79) A23d-05 C11b-07

A mixt. of emulsifiers consisting of 6.0-12.0 wt. % propylene glycol monostearate, 1.0-3.0 wt. % glycerin monostearate, and 0.1-1.0 wt. % soybean lecithin, each based on the wt. of a vegetable fat, is added to the fat and the mixt. is heated until it is melted completely. Then, α -type crystals of the emulsifier mixt. are deposited by cooling quickly and kneading. The mixt. is heated again to a temp. above the m.pt. of β -type crystals of the emulsifier mixt. The temp. is not higher than the m.pt. of the intermediate type crystals. The intermediate type crystals are allowed to deposit by holding its temp. in the temp. range for 1-100 hrs. It is further cooled to the room temp. to deposit the β' -type crystals of the emulsifier mixt. Thus, a fluid fat used for cake-making is prepd.

The fluid fat prepd. has a lower temp. limit of the fluid state as low as 0°C and very high higher temp. limit of the sepn. of crystals by melting as high as 30°C. The fluidity of the fat is preserved for a long time without causing sepn. 21.4.78 as 048288 (5pp126)

Prod. of cake e.g. short-cake - includes addn. of delta-gluconic lactone to non bleached flour
KAOSOAP KK 13.01.78-JA-002460
(08.11.79) A21d-02/18

In the mfr. of cakes from non-bleached flour, the improvement comprises adding to the non-bleached flour 0.1 to 3 wt. % δ -gluconic lactone (I). (I) prevents volume shrinkage of cakes. Used for making roll cake, christmas cake, etc. 13.1.78 as 002460 A21d-2/18 (8.11.79)
KAOSOAP KK (3pp83)(J5 4098366)

QPPP D11 10889B/06 = J7 9037-213
Brightening agent for bread and confectionery - is prepd. by mixing sugar alcohol with egg
Q.P. CORP 31.05.77-JA-062738
E17 (14.11.79) *J53148-558 + A21d-15/08 A23g-03

The brightening agent is prepd. by combining 1.5-18 pts. wt. sugar alcohol with 100 pts. wt. of whole egg. The agent is cheaper and is not oxidn. acidified. It gives a brilliance to bread and confectionery which is not rapidly lost.

Pref. sugar alcohol is sorbitol, maltitol, reduced maltose, millet jelly, etc., and the egg must be fresh. 31.5.77 as 062738 A21d-15/08, A23g-3/00 (14.11.79)
Q.P. CORP (3pp)(J53148558)

DAII D11 33911A/19 = J7 9037-219
Powdery surfactant compsn. for incorporating into food prods. - comprises sugar or sugar alcohol granules contg. surfactant particles and has good foaming and solubility properties
DAIICHI KOGYO SEIYA 02.09.76-JA-105478
(14.11.79) *J53032-162 A21d-02/16

A powdery emulsifying and foaming agent is prepd. by adding surfactant (e.g. sucrose fatty acid ester, glycerol fatty acid ester sorbitan fatty acid ester or propylene glycol fatty acid ester) to sugar and/or sugar alcohol, under melted condition, kneading the mixt. cooling it and crushing it.

The powder emulsifying and foaming agent has excellent solubility in water and foaming property and can be added to powdery foods such as powdery cake mixt without deteriorating the taste or flavour.

The surfactant combines with the sugar and/or sugar alcohol to give a surfactant in sugar type emulsion. The powder prod. has such a structure that the surface of the granules is composed of highly soluble sugar and/or sugar alcohol and the fine granular surfactant is present inside of the granules.

As sugar, soluble sugar such as sucrose, maltose, fructose, glucose, etc. and sugar alcohol such as sorbitol, maltitol etc. are used. They are melted at 100-200 °C and powdery surfactant is mixed in. Pref. sucrose fatty acid opt. with other surfactant is used to provide excellent solubility and foaming property. 2.9.76 as 105478 A21d-2/16 (14.11.79) DAIICHI KOGYO SEIYAKU (5pp)
(J53032162)

KIFO=★ D11 89032B/49 ★SU -654-2
Bread-baking oven - has initial hydrothermal processing section, which conveyor travels up and along while dough pieces are sprayed with steam

KIEV FOOD IND TECHN 15.03.77-SU-462997
(30.03.79) A21b-03/04

Bread-baking oven, in which the pieces of dough are hydrothermally processed prior to being fed into the working chamber of the oven proper, comprises a conveying base which rises up in the zone where the blanks are treated. It is formed into three sections, i.e. the two end parts which slope upwards and downwards, respectively, and the centre horizontal part. Above the conveyor is the steam-moisturising manifold to which perforated tubes are connected. The uniformity with which the steam is distributed over the width of the oven bottom is increased and the consumption of steam is reduced, by positioning the tubes along the direction in which the conveyor is moving and bending them to conform to the profile of the horizontal and sloping parts of the conveyor. The number of tubes equals the number of rows of pieces of dough. The manifold is located at the inlet side of the conveyor and connected to the sloping parts of the tubes.

Shulgin I. M., Bul. 12/30.3.79 15.3.77 as 462997 (3pp29)

MCGR ★ D11 89150B/49 ★US 4175-48
Doughnuts moulded between heated plates - with central well holding oil displaced into cavity when mould is closed
MCGRAW EDISON CO 18.05.78-US-907045
(27.11.79) A21b-05/08

Doughnut maker comprises a pair of heated moulds which are brought together to create toroidal moulding chamber. The lower mould carries a well in the centre of the toroid and the upper mould carries a plunger which is received within the well when the mould parts are closed. Typically the well and plunger are frustoconical. Oil is placed in the well when the moulds are open and is displaced by the plunger when the moulds are closed.

The oil coats the mould when it is closed to produce a doughnut crust. The plunger and well interengage to ensure the accurate closing of the mould halves. 18.5.78 as 907045 (4pp295)

D12: MEAT; FISH PROCESSING

★ D12 87597B/49 ★ BE-876-700
paring coherent flesh product from pieces of flesh - by working,
plying specified emulsifier and then cooking
UNILEVER NV 31.05.78-GB-025164
(30.11.79) A23/A23p

The process comprises first mechanically working on the
ces of $\geq 30g$. to form a sticky exudate on the surface.
en 0.01-5% of an emulsifier is applied selected from
mono- and/or di-glycerides and sodium 2-stearyl-lactyl-
. The coated pieces are then cooked under pressure in
essel such that the temp. in the middle of the flesh is
80°C. The process is applied e.g. to pork, beef, lamb,
oultry and fish. The use of the emulsifier enables great-
cohesion in the product which is stable to reheating.
The emulsifier is pref. applied by powdering the sur-
e, esp. during the mechanical treatment. The pref.
nt. is 0.1-4%. Additionally a water-absorbing agent is
ef. applied which gels on heating, esp. 1-10% of an at
st partly non-gelatinised starchy material, specifically
ya flour, applied after the emulsifier. The cooking is
ef. in an atmosphere of high humidity with a pref. inter-
l temp. of 65-75°C. 31.5.79 as 876700 (6pp597).

★ D12 87844B/49 ★ DT 2822-854
awns or shrimps mechanically crushed between bolts or rolls -
ble flesh is then swept sideways to separate from broken shells
THOMSEN W 26.05.78-DT-822854
(29.11.79) A22c-29

awns, shrimps, etc., specifically North Sea prawns,
e broken up by collecting them individually, esp. by an
Hless belt, from a tank and discharging them onto an
Hless belt or roller system which crushes them to flatt-
the shells. The internal organs are squashed to form a
sh and the fleshy portions are expelled from the shells
H separately removed for use.
An endless belt has hooks each capable of picking up one
awn from the tank, a revolving brush sweeps them from
e belt onto an endless belt cooperating with an upper
lt; as the prawns are conveyed between these two endless
lts over a stationary table a diagonal scraper bearing
wn on the upper belt crushes them. Due to the diagonal
rangement of this scraper the fleshy portions are swept
one side of the belt, while the portions of shell are
nveyed onwards and discharged. The tank may be water-
led and contain a large number of prawns and the water
kept in motion to direct the prawns towards the hooks
the belt.

The pleasant-tasting portions of the flesh are removed
om the internal organs and shell in an entirely automatic
eration. 26.5.78 as 822854 (12pp236).

★ D12 87852B/49 ★ DT 2822-886
ular packing film, esp. sausage skins - of cellulose hydrate
nforced with fibres coated with a binder and an optically active
stance

HOECHST AG 26.05.78-DT-822886
A97 Q34 (A11 A21 A92) (29.11.79) A22c-13 B65d-65/38
Abular packing film of opt. chemically plasticised cell-
ose hydrate has a fibrous insert in the walls. At least
rt of the fibres are coated (partially) with a compsn.
mprising a major proportion of a synthetic hydrophilic
sin precondensate as binder and a minor proportion of
optically active chemical substance.

The fibrous insert is e.g. a paper fibre web coated
th a com psn. comprising a urea-formaldehyde,
elamine-formaldehyde or epichlorohydrin-polyamide-
lyamide binder resin and an optically active substance
ch as a dye or light-protective agent. The web is coated
th viscose soln., treated with a coagulating liq., opt.
eated with a chemical plasticiser and dried.

Prods. are fibre reinforced cellulose hydrate mater-
ls with excellent strength properties. Formation of the
llulose hydrate structure is not hindered as in some
lor processes where the optically active material is
dded to the viscose. The walls of the tube are comprised
ly of cellulose hydrate and opt. the plasticiser. The

prods. are esp. useful as sausage skins. 26.5.78 as
822886 (15pp513).

KOND/ ★ D12 87916B/49 ★ DT 2917-077
Sausage-making press with stack of rectangular frames - made as
single units esp. from drawn or rolled aluminium alloy
KONDIC-DELNON V 16.05.78-CH-005270
(29.11.79) A22c-07

A press for making sausages consists of a rectangular
base plate, a stack of frames of equal size on the base
plate and a top cover applied under pressure. Each frame
is made in one single piece and has a horizontal, outward-
ly projecting flange. The vertical flange of the frame is
reinforced with peripheral ribs.

Preferably, the pressure is applied by ≥ 1 pneumatic
cylinders supplied from a compressed air source and fix-
ed on a top beam above the press, so that the piston press-
es down onto the cover.

Each frame is light and economical to mfr. and is
easy to clean. 27.4.79 as 917077 (8pp236).

★ D12 87930B/49 ★ DT 2919-594
Small crustaceans processing system - using high speed working
medium to crack shells and separate fleshy parts in three stages
PROVISIONS EQUIP (SEAF) 01.12.78-SU-690463 (15.05.78-SU-
614820)
(29.11.79) A22c-29/02 A23k-01/10 A23l-01/32

The fleshy parts of shrimps, krill and other crustaceans
are separated from the shells by moving a working
medium such as air at a velocity which is high enough to
produce a pressure differential between the inside of the
shells and the outside. This destroys the shells. The pro-
cess is pref. done in stages.

The end prod. is pure flesh with a minimum content
of lipids or other underisable admixtures. 15.5.79 as
919594 (+ 13.7.78 - US - 631402) (30pp39).

AIRR ★ D12 88071B/49 ★ GB 2021-382
Two/stage cooling of bacon slabs - prior to slicing with intermediate
holding stage for equalisation of temp. throughout slab
AIRCO INC 30.05.78-US-910918
(05.12.79) A23p-01

Bacon slabs are prepared for slicing by initially cooling
them from $\geq 90^\circ\text{F}$. to an average temp. of $45-50^\circ\text{F}$. The
cooled slabs are held at this temp. to equalise the temp.
throughout the slab. The slabs are then further cooled to
an average temp. of $22-26^\circ\text{F}$. when they are moulded
preparatory to slicing. Pref. the holding time for equalis-
ing the temp. is about 30 mins., and they are pref. held
in an inert atmos.

The method is used to cool cured and smoked bacon
slabs from the smokehouse temperature of about 120°F .
to $22-28^\circ\text{F}$. before being inserted into a mould press.
18.5.79 as 017480 (6pp295)

CASH- ★ D12 88129B/49 ★ GB 2021-725
Safety device for bacon press - has vertically moving transparent
guard door which is released to drop under own weight and
activate press in lowered position
CASHIN SYST CORP 22.05.78-US-908536
Q68 (05.12.79) F16p-03/10

The transparent door prevents operation of press when
in any position other than closed, initiates operation of
the press when closed, and is automatically opened when
the press angle of operation is completed.

The press is entirely enclosed by safety screens and
by the door which may be closable under its own weight
when released. The door is interconnected with the elec-
trical and hydraulic systems of the press. Two micro-
switches are mounted on the door track and have respec-
tive actuating arms engaged by the door. A stop arrests
door movement slightly above the level of the top plate of
the press. 3.5.79 as 015377 (10pp552)

Process to prevent deterioration, partic. discolouration by blackening, of shell fish awaiting freezing for preservation, the process avoids the use of boric acid and sodium bisulphite which have previously been used to prevent blackening, but which have undesirable side-effects.

The shell fish are submerged in an aq. soln. of a harmless acid other than boric acid, e.g. citric, ascorbic or tartaric acid, at a pH 2-4, and the soln. is pressurised to 3 to 6 kg/cm² by injection of CO₂, this pressure being held for a while after which decompression is effected gradually over 1 to 2 mins. 8.5.72 as 045825 (clg. 7.5.71, 24.3.72-ES-390948, 401129) A23b-4/06 (8.11.79)

Conveying system for suspended objects has weighing station - with flexible endless element which bears total wt. of each carrier as it passes through weighing station so that wt. is accurately measured

AUTOSYSTEMS LTD 17.05.78-NL-005289

P43 (20.11.79) A22c-21 B07c-05/22

The system incorporates a weighing station which bears the full wt. of the carriers and their load as they move through the station and is equipped with a wt. transducer which gives an electrical output related to the imposed wt. To ensure that the full wt. of the carrier is born by the weigh device without disturbances due to vibration or oscillation, the carrier is transferred from the conveying track onto a flexible endless element which moves around the weigh station or part of it.

The flexible element is pref. in the form of two chains of rollers linked together with a split in between them through which the hanging element of the carrier can pass whilst the carriage spans the split and is entirely supported on the chains. The chain linkage is such that there is a positive location of the carriage onto the chains and, since the rollers enable the chains to move freely, the motion of

the chains is determined by the motion of the carriage, the conveying system determines the speed of the chains. The chains themselves are supported by a support element which is a part of the weighing mechanism.

The weighing device can be incorporated into, for example, a dead fowl conveying system and will weigh accurately and consistently without being affected by the environment or the vibrations to which the conveying system itself may be subjected. 17.5.78 as 005289 (16pp1370)

Suspension conveyor for animal head processing plant - has contg. hooks and a hydraulically operated remover and deflector whose angle can be varied

MINSK MEAT DAIRY 06.10.77-SU-529172

Q35 (28.03.79) A22b-05 B65g-17

Suspension conveyor, for use in the meat industry to carry the heads of slaughtered animals, etc., comprises body with traction units disposed in it plus hooking equipment, the ends of which are bent in the same direction. Underneath it is a remover operated by a hydraulic drive.

Construction is improved and the field of application is widened, by fitting the conveyor with a sloping deflector plus sensors, to switch on the hydraulic remover. The hooks are fitted with catches to interact with the sensors on the drive. The deflector and the remover are installed so that their slop can be regulated.

Removing the skin from fish, esp fish fillets - with denatured skin washed off by knifelike water jets

LINDWALDS 12.03.75-DT-510711 (05.09.75-SU-171010)

(28.03.79) *DT2510-711 A22c-25/17

Process effectiveness is increased by using as the chemical reagent, an acid, pref. acetic or citric, at 14-20 °C (pref 15-17 °C) the treatment being done by spraying. The fish are loaded on to a conveyor belt, skin uppermost, the sprayed acid being supplied under pressure through spray nozzles. Denaturation of the skins is done by increasing the isoelectric point i.e. by moving the pH into the acid region. The treatment imparts a gelatinous consistency to the skin. The process effectiveness is controlled by varying the speed at which the conveyor travels along, thus fixing the speed at which the fish move through the spray or by changing the pressure of the jets and/or the distance between the nozzles.

Device for removal of internal organs from fish in processing - has spring-loaded fish holder, hydraulic unit and distributor to supply organ removal jet and wash water under pressure

FISHING FLEET DES 01.11.76-SU-416732
(30.03.79) A22c-25/14

The mixt. for use on either ship or shore stations, comprises hydraulic attachments movable in the vertical plane,

water distributor and spring-loaded clips to hold the fish in position and kinematically linked to the attachments.

The removal of the organs from the unoriented fish bodies and economies in water use are guaranteed, by making each of the hydraulic attachments from two parallel spring-loaded hollow movable shells with holes. They are connected to the distributor by means of a shut-off valve. The attachments are also kinematically linked to the clip via the shut-off valve. The clip can be moved by a spring-loaded wedge, movable in the horizontal plane and with a sloping catch. The valve has a spring-loaded piston interacting with the catch.

The force of one spring acts on a wedge which compresses a second spring, so that a rod moves to position the fluted clip for holding the decapitated body of the fish in place. Under the influence of a further spring the hydraulic attachment plus the shut-off valve begin to move downwards. The piston comes up against a catch, compresses a return spring and allows water to come from the distributor to the hydraulic attachment and, at the same time, limit the downward movement. The hydraulic attachment finishes its movement in a position corresponding to one-half the fish thickness. Water under pressure is fed to the distributor and comes out into the abdominal cavity through the shells so that the internal organs are flushed out. When the operation is over the springs act to lift the attachments ready for the next operational cycle.

Enzymatic recovery of carrot juice comprises first thermally pretreating the carrot pulp, then cooling to a temp. between 60 and 80°C which is above the optimum temp. for pectin- and protopectin-degrading enzyme in the carrots. A fungal enzyme complex contg. endo-type pectindepolymerase and pectin esterase components is added.
 The mixt. is incubated for > 1 hr, then the juice sepd.

conversionally from the residue and sterilised. Treatment is at an acidic pH and opt. cellulose- and hemicellulose-decomposing enzymes of microbial origin are present.

Higher yields of juice without the need for multiple temp. changes, so energy utilisation is improved, process is quicker and quality of the prod. is at least equal to that made by other methods (esp. it has a low methanol content). 15.9.75 as 188339 (9pp1251)

UNIL D13 61680Z/00 =DS 1692-388
 Frozen dessert prodn.

UNILEVER NV 30.03.66-GB-014121
 (29.11.79) *GB1158-103 A23g-09

Icecream or frozen foamed desserts are prepd. from fatty acid triglyceride oil, water, casein and > 1 protein (I) with a surface breakdown pressure at an air-water interface less than that of casein. An aq. mixt. contg. 5-25 wt. % triglyceride and 1-6 wt. % casein and protein (I) is homogenised with the ratio of (I) to casein being > 0.25:1 and not so high that sepn. and coalescence occurs in later stages. The remaining casein is then added to the homogenised oil-in-water emulsion which is then frozen and beaten. The remaining casein is added as material contg. > 3 wt. % casein, e.g. as a dispersion of powdered milk. (I) may be α-lactalbumin, β-lactoglobulin and/or gelatin.

The icecream or dessert keeps its shape and texture during storage. 30.3.67 as 692388 (10pp068)

 Gas content of liquid determination - by pressure measurement of agitated liquid in closed space

SYBRON CORP 11.05.70-US-036305

+R16 (D16) (29.11.79) *CA-924-125 G01n + G01n-33/14

The chamber to which a pressure meter is connected for determining the gaseous content of a liq. such as a beverage contg. CO₂ is formed by the pressure chamber of a circulating pump which stirs the liq. as it propels it forward. Pref. a centrifugal pump is used. The vapour chamber is limited by a cylinder having a flow passage into the measuring chamber and a piston which determines the volume of the vapour.

The device dispenses both with complicated adjustments and the loss of time and money involved in the running off to waste of the contents of the test chamber, so that checks can be undertaken continuously and in rapid succession. 11.5.71 as 123375 (10pp1045)

FARH D13 88133V/51 =DS 2327-804
 3,4-Dihydro-1,2,3-oxa-thiazin-4-ones prepn - from chloro-sulphonyl isocyanate and beta-keto ester in 3 stages, used as sweeteners

HOECHST AG 01.06.73-DT-327804

B03 E13 (29.11.79) *NL7407-076 C07d-291/06

3,4-Dihydro-1,2,3-oxathiazin-4-ones (I) and/or their salts (where R₁ is H or 1-4C alkyl; R₂ is 1-4C alkyl) are prepd.

by reacting chlorosulphonylisocyanate and β-keto carboxylic acid tert. alkyl ester R₂COCH(R₁)COOR₃ (where R₃ is 4-10C alkyl) in an aprotic solvent. The prod. is converted to β-ketocarboxamide-N-sulphochloride by cleaning CO₂ and alkylene at 40-100°C. This is then cyclised by cleaning HCl-either by heating to > 50°C or in the presence of an acid binder - and the prod. converted to the salts or free oxathiazone.

Pref. (I) where R₁ is H and R₂ is methyl can be obtd. in 65-70% yield compared with ca. 40% in prior art. No fluoride ions are formed (as with prior method using fluoro-sulphonylisocyanate) so that the prod. can be used directly in food and confectionery. 1.6.73 as 327804 (7pp913)

 Reversible moulds esp. for large area cheese blocks - have arrangements lifting and locking cheese against mould cover

ALPMA ALPENLAND-MAS 23.05.78-DT-822513

P13 (29.11.79) A01j-25/12

Cheese mouldings, esp. those having a large surface area, and which are supported in moulds whilst the whey is draining off, are turned over after the open mould has been covered. Before the first turning operation is carried out, the moulding is lifted in the mould into contact with the mould cover, and during turning they are held

in this position.

Provides a cheese mould in which the moulding cavity can be reduced according to the shrinkage as the whey drains off. The design may also allow for secure stacking of the moulds one upon the other. 23.5.78 as 822513 (14pp)

AHLB- ★ D13 87836B/49 ★DT 2822-628
Aromatic, sour butter prepn. by continuously churning sweet cream - with addn. of acidified culture raised on buttermilk during densifying

AHLBORNE GMBH 24.05.78-DT 822628
(29.11.79) A23c-15/02

A continuously working churn consisting of a rotating cylinder in which beaters are arranged, followed by a secondary buttering drum and a screen for draining off the buttermilk, form the first stage of a plant for the production of aromatic, sour butter from sweet cream. At the delivery end of the screen a kneading trough is fitted and from this the particles of butter floating on the buttermilk are extracted by a worm conveyor, densified and delivered to a mixer. In the kneading trough, an acid culture is added in an amount which is greater than that of the sweet buttermilk bringing the separate particles of butter from the screen into the trough.

Used to convert butter particles from sweet cream by a simple acid culture into sour cream butter and to remedy the failings of existing methods which are not only expensive in themselves but also yield a product lacking in taste and aroma. Provides a continuous prodn. process ensuring the maximal permissible water content and content of matter contg. no fat. 24.5.78 as 822628 (12pp1045).

CALI- ★ D13 87999B/49 ★FR 2417-949
Mechanised de-stoning of fruit, partic. peaches and apricots - with selective scooping of centre only when stone is broken

CALIF PROCESS MACH 05.07.78-US-922183 (22.02.78-US-880229)
(26.10.79) A23n-04/04

The machine is of the type in which a fruit is presented between relatively displaceable blades which cut the fruit on a median plane. The blades grip the stone while the cut halves of fruit are detached by being twisted about an axis at right angles to the median plane. If the stone is broken, this is now detected by reduced resistance to advance of the blades, which continue to close towards each other. This extended motion mechanically triggers a cam-actuated sequence to remove the complete centre of the fruit, including peices of broken stone.

The sequence includes:- (a) retraction of the blades, (b) insertion of a spoon, (c) rotation of the spoon about the axis of its shaft 'handle' thus scooping out the centre of the fruit and (d) retraction of the spoon during cutting and scooping. The fruit is held between opposed grippers, pref. by means of fluid-inflatable diaphragms.

The stone is eliminated from the prod. whether the stone is whole or broken. This is achieved at a single machine station which selectively scoops the centre of the fruit only when a broken stone is detected. It is quicker than previous two-station selective scooping, and gives a higher yield than single-station non-selective scooping of all fruit. 22.2.79 as 004567 (46pp448)

Treating coagulated salt of arginine acid - by contacting it with mixed with rice powder, fish, egg and dry fish meat, with various salts, sugars, alcohol and condiments

KIBUN KK 18.04.78-JA-044824
E12 (26.10.79) C08b-37/04

Treating coagulated salt of arginine acid (i.e. coagulated salt of 2-amino-5-guanidino-valeric acid) is claimed in which a coagulated sodium salt of arginine acid opt. mixed with powdery material involving rice powder, fish egg and fish dry meat is contacted with "edible salt or condiment contg. edible salt" or "alcohol or condiment contg. alcohol" or "sugar or condiment contg. sugar" or "condiment contg. amino acid" or their mixt(s). in its solid state or semi-solid state or its liq. state and thereby, the coagulated degree of the salt of arginine acid or the mixt. is opt. adjusted according to its use.

The condiment contg. edible salt is suitably a mixt. of purified sodium chloride and glutamic acid. The alcohol is ethyl alcohol and the condiment contg. alcohol is a mixt. of Japanese Sake alcohol liquor, whisky, citric acid and tartaric acid. The condiment contg. sugar is a mixt. of sugar, grape sugar, fruit sugar, honey, molasses, fruit juice and ketchup. The condiment contg. amino acid is a mixt. of Japanese Miso, Japanese Soy Sauce, sodium g

mate and inosine mono- or di-phosphate. Further, salt arginine acid comprises calcium salt of arginine acid addn. to Na salt of arginine acid.

Treated salt of arginine acid is used as additive to various kinds of Japanese foods. 18.4.78 as 044824 (9pp15)

BU- ★ D13 88285B/49 ★ J5 4138-086
Producing coagulated salt of arginine acid - by mixing aq. soln. contg. sodium salt of arginine acid with insoluble salt of arginine as coagulant

KIBUN KK 18.04.78-JA-044825
E12 (26.10.79) C08b-37/04

Prod. of coagulated salt of arginine acid is claimed in which an aq. soln. contg. Na salt of arginine acid in concn. ≥ 5 wt. % is mixed with an aq. insoluble salt of arginine acid as a coagulating agent; i. e. powdery calcium salt of arginine acid and the resulting mixt. is homogeneously mixed and then, additional water as required is added to it and thus, the coagulated salt of arginine acid is produced.

Typically, 500 c. c. aq. soln. contg. 3 wt. % sodium salt of arginine acid is mixed with 25 g powdery calcium salt of arginine acid having a granular size of ≥ 50 mesh and the resulting mixt. is homogeneously mixed with an agitating step and in the course of about 15 mins., a jelly-like, coagulated salt of arginine acid is obtd. As another example, an aq. soln. contg. 3 wt. % of sodium salt of arginine acid is coated on and permeated in a surface of sliced meat piece. Then, a film of calcium salt of arginine acid is adhered on the resulting coated surface of the sliced meat piece and thereby, a coagulated layer of calcium salt of arginine acid is produced on the sliced meat piece.

The coagulated salt of arginine acid is used as additive in various kinds of Japanese foods. 18.4.78 as 044825 (6pp)

Preventing putrefaction of foods, esp. fish - using a salt of an amine and esp. sodium glutamate, and opt. and inorganic gas e.g. carbon dioxide

IZAWA T 20.04.78-JA-045913
E19 (D12) (26.10.79) A23l-03/34
The putrefaction of foods partic. fish can be prevented by sprinkling a salt of amino cpd. and that for the object sodium glutamate which is available inexpensively in large quantities, can be used.

It is considered that the sodium glutamate is gradually dissolved and fixes amino acid partic. free amino acids present in foods and that it suppresses the invasion of oxygen in foods through sodium glutamate layer. When inorganic gas such as CO_2 is added with sodium glutamate, the bacteriostatic effect of CO_2 and the antiseptic effect of sodium glutamate act synergistically. 20.4.78 as 045913 (2pp)

DAII- ★ D13 88313B/49 ★ J5 4138-146
Preservative for vegetables, fruit and flowers - is prepd. by adsorbing potassium permanganate on zeolite to decompose ethylene released

DAIICHI NOZAI KK 18.04.78-JA-045664
E31 (26.10.79) A01n-03/02 A23b-07

The preservative is prepd. by adsorbing KMnO_4 on zeolite. The preservative is packaged in proper gas-permeable vessel and is packaged in parcels with vegetables, fruits and flowers to be stored or transported.

Ethylene gas released from vegetables, fruits and flowers which promotes over-maturing, is decomposed. The activity of the KMnO_4 lasts for long time. The ethylene gas is not released. 18.4.78 as 045664 (3pp5)

ASAH ★ D13 88314B/49 ★ J5 4138-153
Smooth, storage stable, creamy food compsn. for coffee cream etc. - contains cellulose based water dispersible complex, milk and/or vegetable fats, emulsifier and water

ASAHI CHEMICAL IND KK 18.04.78-JA-044805
(26.10.79) A23l-01/19

The food compsn. is composed of (a) a water dispersible complex which is prepd. by either mash-kneading 50-95 w/w% of fine crystalline cellulose and 50-5 w/w% of dispersing agent and drying the mixt. or mash-kneading 50-95 w/w% of fine crystalline cellulose and 50-5 w/w% of the mixt. composed of dispersing agent and integrating agent with the wt. proportion 9-1:1-9 in the presence of water and drying the mixt., (b) milk fat and/or vegetable fat, (c) emulsifier and (d) water.

The compsn. is smooth, fine in texture, non-adhesive stable and excellent in form-holding property. It is added to coffee cream to impart stability, smoothness and heavy touch, prevent feathering phenomenon, and improve dispersibility. It is also combined in whipped cream to impart smoothness, heavy and non-adhesive touch, form-holding property and stability. 18.4.78 as 044805 (6pp5)

KIBU- ★ D13 88315B/49 ★ J5 4138-154
Mfg. pressure-resistant watery food prods. - by coagulating powders, lumps etc. and water soluble high molecular substance using salt-type coagulating agent

KIBUN KK 18.04.78-JA-044823
A97 (26.10.79) A23l-01/04 C09k-03

The method is to prepare high pressure-resistible watery solidified prod. using water soluble high molecular substance by coagulating or bonding various powders, granules, lumps or their mixt. The coagulation is effected using one of three methods.

(1) The material is mixed with powdery, granular, flaky, or filmy water soluble high molecular substance and the mixt. is stood to get the mixt. together. Then the mixt. is coagulated by adding a coagulating agent for the water soluble high molecular substance consisting of organic or inorganic salt of di- or more-valent metal. Alternatively (2) the mixt. is coagulated by immersing it in an aq. soln. of the coagulating agent, or (3) the mixt. is coagulated by adding the coagulating agent to the mixt. and immersing the mixt. in the aq. soln. of the coagulating agent.

A coagulated prod. having a pressure resistance as high as $30 \text{ kg}/4\text{cm}^2$, can be obtd. using alginate, CMC or sodium polyacrylate. The method can be adapted not only for foods having excellent hard texture, but also for various industrial uses. Water soluble high molecular substance is not used in the form of aq. soln. and the process is advantageous from the view points of hygiene, waste water problem, labour, electric power consumption, etc. Further water soluble high molecular substance is water absorptive and the safety factor of the foods can be improved. 18.4.78 as 044823 (7pp5)

Sterilising and packaging food materials - involves promoting germination of anaerobic and pref. aerobic bacteria spores before heat treatment

HAYASHKANE SANGYO 22.09.76-JA-112915

(08.11.79) *J53038-643 A23l-03/34

The method comprises adding a germination-promoting substance for anaerobic bacteria spores selected from lactic acid, thioglycolic acid, carbonic acid, their salts and bicarbonates, to the food material, packaging it in air-tight vessels, heating at 75-95°C to active spores of anaerobic bacteria, germinating the spores by keeping them at 30-50°C for longer than half an hour and destroying the spores by heating them at 80-100°C. Pref. a germination-promoting substance for aerobic bacteria selected from aromatic amino acids and purinenucleosides in added together with the germination-promoting substance for spores of anaerobic bacteria.

Heat-resistant spore-forming anaerobic bacteria (e.g. botulism bacillus, Welch bacillus, etc.) in closely sealed foods, which cause bacterial food poisoning and can survive normal sterilisation, can be destroyed completely without using very high sterilising temp., applying synthetic antiseptic or deteriorating the quality of foods such as taste, flavour, texture, etc.

As aromatic amino acid alanine, phenylalanine, tyrosine, tryptophane, etc. and as purinenucleoside inosine, adenosine, etc. can be used. 22.9.76 as 112915 A23l-3/34 (8.11.79) HAYASHIKANE SANGYO (3pp)(J53038643)

ES: N(JA) + E(CH, DT, FR, GB, LU, OE, SW).

Food product is made of grain and contains more than
 7% protein also being free of fibres, fats and oils.

The food is made by mixing malted, partially crushed
 grain with water. The mixt. is heated and the resulting
 liquid is drawn off. The remaining granular material is
 removed in soggy form. Microwave radiation is applied
 to the soggy mixt. to drive off the moisture.

The resulting granular material is next subjected to a
 comp. sufficiently low to embrittle it prior to applying
 mechanical pressure to fracture the husks. The husks
 and remaining granular material are separated and
 finally the fats and oils are dissolved from the granular
 material by a volatile solvent.

The method is used to prepare a high-protein food pro-
 duct fit for human consumption. The pref. starting
 grain is barley.

Diaphragm to be contacted with steam, strong acid, strong
 alkali, oxidising agent, food materials etc. at high temps.
 is made of a fluorine rubber (I) having a number average
 crosslinking degree of ≥ 1.86 and JIS hardness A of ≤ 75 .
 (I) is obtd. by (a) blending a peroxide-vulcanisable F-contg.
 elastomer with an organic peroxide, ≤ 10 PHR organic
 polyallyl cpd. and 0-5 PHR basic metal oxide or hydroxide
 and (b) subjecting to a first vulcanisation and then to a sec-
 ond vulcanisation at $\geq 150^\circ C$ for ≥ 30 min.

Pref. the elastomer is propylene-TFE copolymer, vin-
 ylidene fluoride-propylene hexafluoride copolymer etc.
 The peroxide is pref. α, α' -bis-(t-butylperoxy)-p-diiso-
 propylbenzene, 2, 5-dimethyl-2, 5-di-(benzoylperoxy)-hex-
 ane, etc. and its amt. is 0.5-10 PHR. The allyl cpd. is
 pref. triallyl (iso)cyanurate. Pref. first vulcanisation is
 effected at $100-230^\circ C$.

Prod. has excellent resistances to hot water, steam,
 chemicals, food, etc. non-toxicity, no smell, no taste,
 excellent sealing properties and high mechanical strength.

The plant comprises means for lifting mud from the bed of a pond, base of a settling tank or from a bog; a mechanical excavating shovel is pref. This mud is dumped in the intake tank of a pump, e.g. of the type used for sewage

The pump delivers into a mixer, pref. a concrete mixer, into which is dosed a reagent to solidify the mixt. The reagent can be a commercial prod. such as "Petrifix" (RTM). The mixt. is discharged from the mixer for dis-

tribution to construction site(s). Distribution can be by: road transport tankers or by pumping directly to an adjacent site.

Used for mfg. a bulk material for infilling foundations of building structures, roadways and railways constructions etc. In suitable areas the prod. can be made very cheaply, frequently alongside the construction site. Only conventional, easily operated equipment is used. 22.2.78 as 005007 (6pp448)

ICIL ★ D15 88029B/49 ★FR 2418-252
Amphoteric ion-exchange resin capable of thermal regeneration - prepd. from acidic and basic monomers in presence of inhibitor (J5 5.10.79)

ICI AUSTRALIA LTD (CSIR) 27.02.78-AU-003526
A91 (26.10.79) C08j-05/20

An amphoteric ion-exchange resin is prepd. by suspending particles of an ion-exchange polymer in a liq. phase based on a precurator capable of being transformed into an ion-exchange polymer matrix of opposite type. The matrix encapsulates the polymeric particles. Matrix formation is effected in presence of an inhibitor.

The resins are used esp. for demineralation of saline solns. over prolonged periods, with intermittent thermal regeneration. Classical procedures are not always satisfactory for the prodn. of resins of this type, probably because of internal salt formation. Use of inhibiting agent gives a resin which, after sepn. of the inhibitor, has ion-exchange capacity up to 45% greater than that of resins prepd. in absence of inhibitor. 26.2.79 as 004855 (17pp)

B32b-07/08 B32b-27/06

Construction of a matrix of sheets or plates providing a series of fluid flow passages between the individual sheets or plates for use in interacting processes between fluid flows, is described. The sheets or plates are preformed with co-operating protuberances and/or depressions so that the sheets or plates are interengaged with each other when assembled. Heaters are applied from one side of each pair of mutually interlocked sheets or plates to produce a welded joint between them.

Pref. the sheets or plates are formed of thermoplastic polyolefin and/or vinyl chloride polymer.

The matrix is useful in e.g., mixing, distn. absorption, cooling of liqs., cleaning of combustion gases and biological oxidn., etc. and is partic. useful in food and medical technology due to the absence of use of adhesive in its construction. 31.10.77 as 045171 (5pp393)

BRPE ★ D15 88052B/49 ★GB 1557-067
Crude oil recovery from reservoir - by injection of sea water from which detritus has been removed by novel filtration process

BRITISH PETROLEUM LTD 20.09.76-GB-038856

H01 J01 Q49 (05.12.79) B01d-37 B01d-41 E21b-43/20

Filtration of sea water contg. macerated organic and inorganic detritus involves filtering the sea water through a filter medium. Periodically the flow is discontinued and the filter medium regenerated by directing a jet of a wash liquid onto the residue retained by the filter from the same side of the filter medium as the residue with sufficient force to dislodge the residue.

Backwash techniques are inefficient in removing the residue and thus regeneration becomes a lengthy procedure. The present invention enables the residue on the filter to be readily removed.

Also claimed is the recovery of oil from a coastal or offshore reservoir by filtering sea water and injecting it into the reservoir through an injection well. Crude oil is recovered through a production well. 12.9.77 (3pp1345)

SHEL ★ D15 88059B/49 ★GB 1557-182
Dispersing compsn. for oil slicks - comprising mixt. of ester(s) of fatty acid and polyethylene glycol in ether solvent

SHELL INT RES MIJ BV 12.11.75-GB-046704

A97 E17 H03 (A25) (05.12.79) C02b-09/02

Compsn. for dispersing spilt oil comprises an emulsifier component (A) comprising or contg. either (i) a mixture of an ester (I) of an 8-22C carboxylic acid and diethylene glycol with an ester (II) of an 9-22C carboxylic acid and a polyethylene glycol of mol. wt. 200-500 or (ii) a mixt. of esters (III, IV) of an 9-22C carboxylic acid and polyethylene glycol, the ave. mol. wt. of the polyethylene glycol being 100-300 higher in (IV) than in (III), and (B) a solvent component comprising or contg. an ether of formula $R(O-R_1)_n-OR_2$ (V) (where R is 1-8C alkyl, R_1 is 2 or 3C alkylene, R_2 is H or 1-8C alkyl, and n is 1-3).

Compsn. is for use in treating oil slicks on fresh or sea water. The use of the ether solvent (V) to replace, at least partially, the usual kerosene solvent gives a comps. of higher active mass (e.g. 40-80 wt.% emulsifier cf. 10-20 wt.% using kerosene) and thus reduces transport problems and costs. The comps. are also more compatible with water, esp. sea water. 10.11.76 (5pp909)

Repairing leaking hollow fibre membrane-filled module - by forcing liq. adhesive, e.g. polyurethane or epoxy resin, into open fibres and solidifying

KURARAY KK 20.04.78-JA-048280

A81 J01 (27.10.79) B01d-13

A method of repairing the leaking portion of a hollow fibre membrane module, used in the treatment of various liquids comprises applying a fluid adhesive (e.g. a two-component polyurethane or epoxy resin, a synthetic rubber, natural rubber, silicone rubber, a vinyl ester, an unsatd. ester or an EVA copolymer) onto ≥ 1 end of the open-ended hollow fibres of the hollow fibre membrane-filled module forcing the adhesive into the leaking portion of the fibres by pressure, solidifying and cutting the sealed portion of the hollow fibres so that no open ends of the hollow fibres are formed. 20.4.78 as 048280 (4pp117)

ISHI/ ★ D15 88452B/49 ★ J5 4138-883
Sponge material for sepn. of oil and water - has oil layer on surface, so water is repelled and oil is absorbed
ISHIGAKI Z 19.04.78-JA-048032
J01 (27.10.79) B01d-17

The material is given an oil layer coating on its surface. The sponge material is used for recovering oil floating on the surface of industrial waste water, and makes it possible to reduce operation costs and to enhance the recovery rate.

Sponge materials generally have a hydrophilic part and a hydrophobic part. The hydrophobic part can absorb the oil, while the hydrophilic part does not absorb oil. When such sponge materials were immersed in industrial waste water contg. oil, hydrophilic parts of the sponge absorb water and lead to an increase in wt. However, since this sponge material covered with a hydrophobic layer, water is repelled and oil is absorbed well. The sponge material may be used for recovering oil which accidentally flows in since it floats on the surface of water. 19.4.78 as 048032 (2pp96)

HITA ★ D15 88475B/49 ★ J5 4139-257
Desalination filter for high temp. water from nuclear reactor - produced by forming metal oxide on porous metal prod., immersing in metal alkoxide, and heating to bind oxide film and fine oxide granules

HITACHI KK 21.04.78-JA-046612

J01 K07 (29.10.79) B01d-15 C02b-01/40 G21f-09/06

The filter is produced by (i) heating a porous sintered metal prod. having ion exchangeability to form metal oxide surface film; (ii) immersing the porous sintered metal prod. on which the oxide film is formed in a metal alkoxide, e.g. Ti tetraisopropoxide etc. then in water to adhere fine granules of the metal oxide to the inside of fine holes of the porous metal sintered prod., (iii) drying the sintered prod. and (iv) heating to bind together the oxide film and the fine metal oxide granules.

The porous metal sintered prod. is e.g. Ti sintered prod. The fine metal oxide granules are adhered to the inside of the fine holes, e.g. by deaerating in vacuo the porous metal sintered prod., immersing it in Ti tetraisopropoxide then in water to hydrolyse Ti isopropoxide. 21.4.78 as 046612 (5pp34)

NIPE- ★ D15 88476B/49 ★ J5 4139-258
Organic sludge treatment - by pretreatment with hydrogen peroxide and opt. iron salt and adding polymer coagulant
NIPPON PEROXIDE KK 21.04.78-JA-046517
A91 (29.10.79) C02c-03

Method comprises pretreating the sludge with H_2O_2 , the amt. of which is 500 to 2,000 ppm, (1,000 to 1,500) ppm, if necessary together with iron salt, e.g. $FeSO_4$ and $Fe_2(SO_4)_3$ etc., the amt. of which is 0-20%, (2.0-10.0%), and subsequently adding cationic, anionic or nonionic polymer coagulant in amt. of 100 to 200 ppm. Organic sludge, e.g. surplus sludge and sea water sludge etc. is effectively dewatered by filtration under excellent workability with a saved amt. of polymer coagulant without any generation of bad odour.

In an example, 1,500 ppm H_2O_2 (based on slurry) and 5% of $FeSO_4$ (Against the solid content) were added to 200 ml of a surplus sludge (solid content: 2%) obtd. by diluting 2 pts. of night soil waste water sludge with one part of sea water, followed by stirring for 5 mins., after which 150 ppm of polymer coagulant (against the slurry) was added thereto followed by agitation for 30 secs. The size of flocs is very large and it is effectively dewatered by filtration and easily peeled-off from filter cloth. 21.4.78 as 046517 (3pp34)

HITK ★ D15 88477B/49 ★ J5 4139-261
Treating chromium-contg. sludge - by multistage incineration followed by heating of ash in presence of oxygen and carbon monoxide
HITACHI METAL KK 21.04.78-JA-047463
J09 (29.10.79) B01j-01 C02c-03

Cr-contg. sludge from the treatment of sewerage or industrial waste water etc. is treated by (a) incinerating in multi-stage incinerating furnace after drying, and then heating the ash obtd. at $>600^\circ C$ under reducing (sic) in the

presence of $< 1\% O_2$ and 0.1-1% CO .

Cr^{6+} contained in the ash is almost completely converted to Cr^{3+} , and the sludge is made harmless and suitable for land reclamation. In order to maintain the reducing atmosphere a reducing gas e.g. CO etc. may be introduced, or matter capable of generating CO gas, e.g. activated charcoal and finely powdered coal etc. may be added to the reducing region of the furnace. 21.4.78 as 047463 (2pp34)

KAOS ★ D15 88478B/49 ★ J5 4139-262
Purifying surfactant-contg. waste water - by adding inorganic coagulant and opt. acid, and removing obtd. flocs
KAO SOAP KK 20.04.78-JA-046787
(29.10.79) C02c-05/02

Method comprises adding an inorganic coagulant, e.g. $Al_2(SO_4)_3$, $NaAlO_2$, polyaluminum chloride or $Fe_2(SO_4)_3$ in an amt. of 100 to 5,000 ppm against the amt. of the surfactant opt. adding an inorganic acid, e.g. HCl or H_2SO_4 to adjust the pH to 2-5, and removing flocs thus formed together with rising air bubbles.

Reduced amts. of coagulant are required and only a small amt. of sludge is generated.

In an example, 500 ppm of $Al_2(SO_4)_3$ is added to waste water contg. 200 ppm of Na dodecylbenzene sulphonate (as an anionic surfactant) followed by filtration at a pH of 4.2. Removability of the surfactant was 90%. The coagulant used is sepd. from the sludge and maintained in the waste water so it is possible to recover it for reuse. 20.4.78 as 046787 (3pp34)

Semipermeable membrane prepd. from crosslinked aceto-modified PVA - used for desalting of brine, concn. of solns. or dialysis of blood

SEKISUI CHEMI IND KK 21.04.78-JA-048067

A88 J01 (A14 A25) (30.10.79) B01d-13/04

The membrane is produced by shaping the polymer to a film type membrane, and contacting the membrane with a cross-linking agent having a functional gp. which can be reacted with a functional gp. of the membrane.

In an example, a polymer of vinylalcohol was contacted with dimethylaminoacetal to obtain aminoacetal modified PVA. The obtd. PVA was dissolved in deionised water, and filtered to obtain a soln. of 0.5 wt % of the polymer. The soln. was poured on a glass plate to obtain a film type membrane 9.8 μ thick. The membrane was set in an atmosphere of glyoxal for 30 mins. to obtain cross-linked semipermeable membrane. 21.4.78 as 048067 (7pp51)

Polyampholyte mfr. from chloromethylated styrene contg. polymer
includes amination with hexa:methylene-tetramine in mixt. of
methylal and methanol, used for metal ion removal from aq. waste

SAMBORSKII V 18.11.76-SU-420695

A91 J01 M25 (28.03.79) C08f-08/30 C08f-212/36

A polyampholyte used for sorption and other chem. pro-
cesses, esp. removing metal ions from effluent streams
and having a high Cu sorption vol. is obtd. by (a) aminat-
ing a chloromethylated macro-porous copolymer of sty-
rene and divinyl benzene with hexamethylene-tetramine in
a solvent comprising a mixt. of methylal and methanol
in a wt. ratio of 20-60: 80-40; (b) subjecting the prod.
to an alcoholic acidolysis to form primary amino gps.;
(c) further aminating the prod. with NH₄OH; and (d) treat-

ing the amino gps. with monochloroacetic acid in the pres-
ence of Ca acetate as neutralising agent. The method is
simpler and quicker than prior art and reduces solvent
waste. The acidolysis is pref. carried out with HCl in
(m)ethanol.

In one embodiment, the copolymer is further chlorome-
thylated by conducting the acidolysis in the presence of a
chloromethylating catalyst (e.g. ZnCl₂) at 65-70°C for
12-15 hrs.

Waste water cleaning filter - has body divided into raw liquid and
filtrate chamber with perforated rings and plates, and removable
filter cartridges

PONOMARENKO V S 15.10.76-SU-412088

J01 (30.03.79) B01d-27/12

Filter for cleaning liquids, e.g. natural and recirculating
or effluent waters from suspended impurities and petrol-
eum prods., as well as clarifying potable waters, and
cleaning waste waters prior to re-use, etc.

It consists of a body, divided by tubular gratings into
chambers for the initial suspension and the filtrate, dist-
ributor and filtering elements. The latter are mounted
in the tubular gratings and made as perforated rings with
holes in their faces, there is also a framework of plates.

The quality with which the filter elements are regener-
ated is increased and consumption of liquid is reduced
during the regeneration, by perforating the plates in the
framework. The holes in the faces of the perforated rings
used in the initial suspension chamber have a smaller dia.
than the holes in the rings used in the filtrate chamber.

Settling tank for an oil-solids-water mixture, partic. oil-
field water to give a product suitable for discharge or well
injection, is assembled by mounting two vertically spaced
forwardly inclined baffles to form lower, intermediate and
upper compartments in an upright tank with lower rear in-
let passing mixture across the length from back to front.

Lower front and upper rear ports are formed in the
lower and upper baffles respectively, and a cleaned water
outlet is formed in the upper compartment lower end below
an oil outlet. Each baffle pref. has parallel V-shaped
grooves in its undersurface to trap, guide and coalesce
oil droplets. The parent patent claims the appts. 30.5.78

Adaptor for liq. manure vacuum agitator - comprises cylindrical
tube with a spiralling blade attached to its inner wall

PRIMUS D R 28.09.78-US-946827

(27.11.79) B01f-13/06 B01f-15/02

An adapter, for a liq. manure vacuum agitator, which

draws liq. manure through the free end of a tank while applying vacuum to a hose at the other end, comprises an elongated cylindrical tube, to the inner wall of which is attached a continuous spiralling blade of width less than the inner radius of the tube, thus leaving an open centre through the tube. One end of this tube is connected to the free end of the hose.

The system agitates liq. manure while allowing passage of particulate material through the hose. Settled solids at the bottom of the liq. manure pit may be loosened and dispersed. The device is cheap, simple and durable. 28.9.78 as 946827 (4pp976)

Appts. for distn. of salt water - in deaerated coiled conduit divided by partition into distilland and distillate troughs

BRYANT JJ 10.01.78-US-868440

J01 (27.11.79) C02b-01/06

A distn. appts. comprises a deaerated conduit having an inlet and an outlet end and coiled so that adjacent loops of the coil extend continuously from the inlet to the outlet. A partial partition extends from the inlet to the outlet and divides the conduit into an inside distilland trough for carrying an impure liq., and an outside distillate trough carrying condensed vapour.

Impure liq. is delivered to the inlet end of the distilland trough at a selected temp. and pressure. The impure liq. and vapour arising from it flow along the distilland trough towards the outlet. The flow of vapour passes across the partition under centrifugal force to the distillate trough which it condenses.

The appts. is used for producing potable water from salt water. Compared with prior art appts., the device reduces energy costs by conserving heat and reducing its loss. 10.1.78 as 868440 (7pp295)

Brine desalination process - giving concentrated brine which is electrolysed

DESAL-CHEM INC 05.10.78-US-948668

J03 (27.11.79) B01d-03/10 C25b-01/28

Brine of salinity $7\frac{1}{2}$ -9% is introduced into a concentrator consisting of upper and lower chambers interconnected by vertical tubes, surrounded by a closed shell extending between the chambers. Vapour is withdrawn from the upper chamber, compressed and introduced into the space around the tubes. Condensed fresh water is withdrawn from this space, and concentrated brine of salinity about 28% is removed from the lower chamber. This is passed to a stack of electrolytic cells, where it is electrolysed to produce chlorine, a small amt. of hydrogen, caustic alkali which is mainly NaOH, and an inert material contg. Mg and Ca oxides. The chlorine is passed through a mist separator and compressed to a liquid.

The process is esp. useful for brines obtd. from bores e.g. in oil prodn., which otherwise have to be injected into the ground. The system is efficient, produces pure prods. is simple to operate, and may be mobile. 5.10.78 as 948668 (6pp955)

 Moulded articles with an enzymatically active surface - by applying an adhesive and an enzyme immobilized on a solid carrier
 BOEHRINGER MANNHEIM GMBH 09.08.74-DT-438436
 A96 B04 R16 (29.11.79) *NL7509-345 C07g-07/02 C12d-13 G01n-31/14

Moulded articles with enzymatically active surface is made by coating the article with an adhesive then applying a particulate material comprising a solid carrier and an immobilised enzyme.

Pref. the article is of metal, plastics or glass. It is coated with synthetic adhesive, and the carrier material comprises mainly acrylamide units. The adhesive is used as a liq. and hardened or dried. The article is used as a reactor in chemical or clinical enzymatic analyses, or as an enzyme reactor in preparative chemistry. 9.8.74 as 138436 (8pp913)

 Identification of microorganisms in sub-samples - with different growth-inhibiting agent added to each and statistical evaluation (NL 8.78)

PFIZER INC 17.10.77-US-842736 (28.01.77-US-763719)
 B04 + R16 (29.11.79) *DT2803-044 C12k-01/04
 Microorganism strains in liq. samples are determined by dividing into sub-samples and simultaneously inoculating each with different special growth inhibiting agents, which in reaction with the sub-samples produce properties allowing identification of the microorganism. The special antimicrobial agents are not those usually employed for the

therapy of the microorganisms.

The samples are incubated for a short period to develop possible significant growth differences for the microorganisms in each sub sample. The growth is determined photometrically or otherwise, all measurements being completed in a short time, so that growth differences relative to time difference can be ignored. The growth observed is then compared with a memory of microorganism identifying data relative to the special reagents.

The method can be used for any determination of the susceptibility of bacteria or other microorganisms. A total of 36 specific agents are claimed. 25.1.78 as 803044 (11pp)

 Conversion of waste paper by enzymatic hydrolysis - to produce substrate for biomass for animal feed prodn.

VU PAPIERU CELULO 26.05.78-DT-823123

C03 F09 (D13) (29.11.79) A23k-01/12

A process for utilising waste paper and other fibrous polysaccharide-contg. waste material is claimed. The process comprises slurrying the material, treating the slurry with an enzyme soln. to produce a mixt. with a solids content of 1-30%, and stirring the mixt. at 20-70°C until the product has the desired physical properties and nutrient content.

The product is useful as a culture substrate for the prodn. of microbial biomass for animal feed prodn.. The starting material is pref. pulped, washed and dewatered to produce a slurry with a solids content of 20-50%. The slurry is mixed with an aq. cellulose soln. to give a mixt. with a solids content of ca. 10%, and this is stirred at 20-60°C until optimum monosaccharide prodn. is achieved. 26.5.78 as 823123 (13pp367).

MILE★ D16 87909B/49 ★DT 2901-542
 Reducing thermal stability of microbial Mucor rennin - by treating its aq. soln. with hydrogen peroxide NL 26.11.79)

MILES LABORATORIES INC 22.05.78-US-908575

(D13) (29.11.79) A23c-19/02 C12d-13/10

The thermal stability of microbial Mucor rennin is reduced by treating an aq. soln. of the rennin with H₂O₂. The H₂O₂ is pref. added in an amt. of 1-25 (esp. 3-10) vol.%. The treatment is pref. effected at 4-30°C and pH 4.0-8.0 for 15-72 hr.. The H₂O₂ can opt. be formed in situ from a peroxide (esp. Ca peroxide). Residual H₂O₂ after the treatment can be destroyed with catalase, peroxidase and/or ascorbic acid.

Pasteurisation of the whey obtained when the destabilised rennin is used in cheese mfr. largely destroys residual milk-coagulating activity, so that the whey is suitable for use in the foodstuffs industry. 16.1.79 as 901542 (30pp367).

Microbiological prodn. of acyl-coenzyme A synthetase LCF-18 prodn. - by cultivation of e.g. *Escherichia*, *Aerobacter*, *Serratia*, *Proteus* species, etc.

AMANO PHARM KK 26.01.79-JA-007244 (15.05.78-JA-056604)

B04 R16 (29.11.79) C07g-07/02 C12d-13/10 C12k-01 C12k-03 G01n-33/16

The prodn. of acyl-CoA-synthetase LCF-18 comprises (a) cultivation of an acyl-Co A-synthetase LCF-18 producing strain of the genus *Escherichia*, *Aerobacter*, *Serratia*, *Proteus*, *Salmonella*, *Staphylococcus*, *Corynebacterium*, *Pseudomonas*, *Aeromonas*, *Streptomyces*, *Aspergillus*, *Penicillium*, *Fusarium*, *Gibberella*, *Candida*, *Gloeophyllum*, *Trametes*, *Daedalea*, *Laetiporus*, *Flammulina*, *Lentinus*, *Lenzites*, *Pycnoporus*, *Tyromyces*, *Coriolus* or *Schizophyllum*, and (b) isolating the enzyme acyl-CoA-synthetase LCF-18 from the cultivated cells.

Acyl-CoA-synthetase LCF-18 has high activity with regard to 16-18C fatty acids and can be used in the accurate determination of unesterified human fatty acids, which is useful in the diagnosis of diabetes. Acyl-CoA-synthetase with similar activity has previously only been available from rat's liver. 3.5.79 as 917891 (31pp280).

GYOG ★ D16 87983B/49 ★DT 2921-022
Nebramycin antibiotic complex microbiological prodn. - by cultivation of nebramycin-resistant strains of *Streptomyces tenebrarius*

GYOGYSZERKUTATO INT 23.05.78-HU-GO1404

B04 (29.11.79) C12d-09/16

In a new process for the microbiological prodn. of the nebramycin complex, (a) a strain of *Streptomyces tenebrarius* which biosynthesises the nebramycin complex is cultivated in a nutrient medium contg. nebramycin 2, nebramycin 5' and/or nebramycin 6 and the individuals forming growing aerial mycelium and spores in the presence of 10-30 mg/ml of these antibiotics are isolated; (b) the resulting new resistant strains are cultivated in a submerged aerobic culture in a nutrient medium contg. N- and C-sources, inorganic salts and (opt.) vegetable and/or animal fats at 30-42°C (pref. 35-38°C); and the nebramycin complex or nebramycin 2, nebramycin 4 and nebramycin 5' accumulating in the medium is isolated.

Nebramycin 2 (apramycin) is used in the treatment of diseases of animals and plants (cf. US 3691279, 3853709, 3876767). Nebramycin 6 (tobramycin), produced by hydrolysis of nebramycin 5' (6''-O-carbamoyl-tobramycins), is a broad spectrum antibiotic used in human medicine, esp. against polyresistant *Pseudomonas* strains. Use of selected nebramycin-resistant *Streptomyces tenebrarius* strains allows the prodn. of cultures with high nebramycin concns. thus giving improved yields. 23.5.79 as 921022 (35pp280).

Marine salts enriched with biological prods. for food and cosmetic use - prepd. by fermentation using phytoplankton cells

AUBERT M 23.02.78-FR-005802

A88 (D13 D21) (26.10.79) A231-01/23 A61k-07 C12d-13

The salts are prepd. by adding nutritive substances, such as nitrates or phosphates, to sea water in a vessel, then inoculating the mixture with phytoplankton cells. After 10 days when the number of cells has considerably increased, the culture medium is filtered and the filtrate is evaporated and dried under vacuum at 40-50°C.

The product is used wither (a) as bath salts or in cosmetic products or (b) as a food supplement. As (a) it has a sea odour, a soft consistency and is nutritive to the epidermal cells; and (b) it is beneficial as a result of the synthesised substances such as vitamins that it contains.

The phytoplankton cells are pref. diatom, specifically *Chaetoceros teres* and/or *Asterionella japonica*. In the prepn. the culture is pref. filtered first through nylon mesh of 100 μ dia. and then through material of 10-0.5 μ mesh dia. 23.2.78 as 005802 (4pp597)

COMS ★ D16 88041B/49 ★FR 2418-022
Device for sepg. e.g. antibodies in radioimmunology - having extended surface of material adsorbing or covalently bonding with antibodies and fixable in tube above end

COMMISS ENERGIE ATOMIQUE 22.02.78-FR-005040

A89 B04 J04 R16 (26.10.79) G01n-01/28 G01n-33/16

The device is fixed in a tube closed at one end and is forced so as to present a large surface to the soln. being tested, and to permit the soln. to pass to the end of the tube. The material from which the device is made permits a degree of elastic deformation to hold the device in the tube, and is capable of fixing a biological compound from the soln. or its specific antagonist compound, e.g. an antigen or the antibody. Nylon is preferred.

The length of the device will be such that it is just submerged in the soln. The device may have the form of a cylindrical sleeve having longitudinal ribs, pref. curved over at their ends, engaging the inner surface of the tube. Alternatively, the device may have an elastic head part fixing it into the tube and a spiral part beneath it. The head is pref. pierced with a central aperture to allow the soln. to pass.

The device is used in analyses of solns. of biological compounds which interact e.g. forming a complex. Thus can be used to fix the marked and unmarked antigen-antibody complex in a radio-immunological analysis. The devices can produce consistent results, being manufacturable in standard identical form. 22.2.78 as 005040 (12pp)

Electrode for determn. of concn. or activity of enzymes - contains a coenzyme for oxido:reductase, and an electron-collecting substance

MATSUSHITA ELEC IND KK 21.04.78-JA-047984

A89 B04 J04 R16 (30.10.79) G01n-27/40 G01n-33/16

The electrode contains a coenzyme for oxidoreductase and (II) and electron-collecting substance, (I) is directly chemically bonded with (II) a polymeric carrier and is mixed with (II). The oxidoreductase is fixed on or near (II).

Since (I) is oxidised with good efficiency, the determn. is carried out rapidly and simply. (II) is e.g. carbon SnO_2 , In_2O_3 , WO_3 , TiO_2 , etc.; and (II) is an organic carrier, e.g. cellulose or albumine, or an inorganic carrier, e.g. glass, alumina, SnO_2 , etc. When the electrode is only fixed with coenzyme without combining it with fixed enzyme, the activity of the enzyme can be determined.

In an example, NAD was reacted with succinic anhydride in dimethylsulphoxide to introduce the carboxyl gp. into the molecule. The NAD deriv. was reacted with aminohexyl-cellulose in dicyclohexylcarbodiimide to fix NAD on the cellulose deriv. by amide-bonding. The NAD-fixed cellulose was mixed with graphite powder and press-moulded to give NAD-fixed electrode. The electrode was dipped in a soln. contg. lactic dehydrogenase to prepare NAD-enzyme bonding substance, which was then treated with a cross-linking reagent to give the coenzyme enzyme-fixed electrode. 21.4.78 as 047984 (5pp90)

Enzymic electrode for selective determn. of tri:methylamine comprises electrode contg. oxido-reductase, coenzyme and current collector

MATSUSHITA ELEC IND KK 24.04.78-JA-048879

E16 J04 R16 (31.10.79) G01n-27/40 G01n-33/16

Enzyme electrode contains at least (a) oxidoreductase, (b) coenzyme and (c) current collector and (a) and (b) are fixed on or near (c). (a) is trimethylamineoxide reductase and (b) is nicotinamide adenine dinucleotide. A redox cpd. which conjugates with (b) to form electron-transferring cpd. is fixed on or near (c).

(a), (b) and redox cpd. can be reused. The enzyme electrode is useful for convenient sensor for determining tri:methylamine which is a useful criterion to assess the degree of food decay.

In an example, 0.3 mg trimethylamine oxide reductase extractase extracted from gram-negative bacillus of *Flavobacterium* and 0.4 mg coenzyme were dissolved in phosphate buffer (pH 7). A disc of 15 mm dia. was formed by press-moulding graphite powder. The above soln. was applied on the disc and dried. The dried surface is treated with glutaraldehyde to crosslink the coated film. An enzyme electrode is produced by using the enzyme-coenzyme fixed disc. 24.4.78 as 048879 (4pp90)

Fixing microbial body contg. lipase - by heating lipase-producing bacteria belonging to *Pseudomonas* to 50 to 90 degrees celsius
AGENCY OF IND SCI TECH 00.00.76-JA-132971 (09.11.72-JA-112499)
(08.11.79) *J52054-082 C07g-07/02 C12k-01 + C12d-13/10

Applicable stocks are e.g. *Pseudomonas mephitica* var. *lipolytica*, *Pseudomonas aeruginosa*. The stocks are cultured ordinarily in a culture medium, in which inorganic nitrogen source such as ammonium sulphate is added to increase intracellular production of lipase. Pref. the treatment is practised immediately after the culture to avoid autolysis. Before the treatment microbial body may be washed with water.

It is desirable to stabilise lipase previously either by adding the inhibitor which hardly inhibits lipase and inhibits the enzymes relating to the solubilisation of lipase or by treating microbial body at pH 3.5-6. The obtd. fixed lipase shows similar enzymic properties to the soluble lipase produced in the culture medium and has rather higher activation energy. Lipase can be fixed economically and effectively. 9.11.72 as 132971/76 Div ex 112499/72 (C07g-7/02; C12d-13/10; C12k-1/00 (8.11.79) AGENCY OF IND. SCI. TECH. (5pp) (J5 2054082)

Vinegar prodn. with high acetic acid concn. - by two stage
submerged fermentation of an alcohol contg. medium
FRINGS H FA 22.12.75-US-643297
(10.11.79) *DT2657-330 + C21j-01/04

Prodn. of vinegar of acetic acid (I) concn. < 15 w/v%
comprises submerged cultivation of an aq. mixt. of alcohol
(I), bacteria (*Acetobacter*) and nutrients at an initial
concn. of 7-10 w/v% (I) and total concn. 12-15% (i.e.
concn. of (I) plus that of alcohol in vol. %). In a first
fermentation stage the total concn. is adjusted to > 15%
by adding a 30-100% alcohol soln., so that (I) concn. is
increased to < 15%. In a second stage the tota concn. is
kept constant at > 15, pref. 15-17% and fermentation
continued until alcohol concn. is < 0.5%.

Pref. at the end of the first stage 20-50% of the fermen-
-tation liquid is separated when (I) concn. reaches 13-15%
transferred to a second reactor, and the residue left in
the first reactor is treated to restore (I) and total concns.
to their initial values. The process is repeated as often
as required.

The vinegar is used in food preservation. Highly conc.
vinegar (lower storage capacity and freight costs) can be
prod. because oxidn. of alcohol to (I) continues after
the end of the bacterial propagation stage. (The bacteria
are killed by this high acid concn. so process must be
in 2 stages to retain a viable culture). 10.5.76 as 052300

Determin. of bacterial concn. in a test fluid - by chemiluminescent assay involving removal of interfering materials

NAT AERO & SPACE ADMIN 09.02.78-US-876440
(27.11.79) C12k-01/04

Interfering luminescence produced by agents unrelated to the concn. of bacteria in a test fluid during a chemiluminescent assay is eliminated. First, a predetermined amt. of test fluid is treated with a reagent to reduce luminescence-producing organic materials. The reagent is a H₂ soln. and its concn. determines the contact time.

Then the mixt. is treated with a second reagent that

releases components of the bacterial cells and reacts with the components to cause luminescence. The reagent contains NaOH and the iron porphyrins released react with a luminol/H₂O₂ mixt. also in the reagent. The mixt. is allowed to luminesce to maximise decay of luminescence produced by inorganic agents in the test sample. Then the remaining luminescence is measured and the measurement is visually displayed to indicate bacterial concn.

The method is more accurate than prior methods, the effects of interfering materials being eliminated so that the luminescence only relates to the bacteria present. The method is used in an automated system. 9.2.78 as 876440 (9pp1248)

SELW- ★ D17 87781B/49 ★ DS 2833-348
Preliminary liming plant for raw sugar beet juice - stands vertically and recirculates part flow to ensure uniform alkalinity
SELWIG & LANGE MASC 29.07.78-DT-833348
(29.11.79) C13d-03/02

The juice of sugar beet obtd. by extraction is limed preliminarily in a vertical cylinder having at one end an inlet for the raw juice and at its other end an outlet for the treated product, together with a feed opening for the milk of lime. The cylinder is divided by roughly horizontal partitions into chambers one above the other. These have passages which allow an interchange of fluid between them. Agitators for the fluid are fixed to a vertical shaft, centrally positioned in the cylinder. These bring about a partial reversal of the flow from the inlet to the outlet and a mixing of the raw juice of one chamber with that of an adjacent chamber.

The flow reversing agitators are formed by a system of pipes each of which is bent at an angle and connects two chambers together. Each pipe has a suction inlet formed at the top end of a vertical leg and an outlet at the outer end of an horizontal leg, in the lower of the two chambers, when the cylinder is arranged with the raw juice inlet below and the outlet above.

Improves the design of the machine particularly as regards the partial reversal of flow so that more accurate fixing of the pH values is obtd. in the separate chambers. 29.7.78 as 833348 (6pp1045)

Splitting polysaccharides contained in row matls by acid hydrolysis - using two-stage process requiring only one reactor vessel
ROSENLEW OY W AB 04.10.74-SF-002911
E13 F09 (17.03.79) *DT2541-119 C13k-13

A continuous procedure for breaking down by acid hydrolysis under pressure and increased temp., raw materials contg. polysaccharides, and obtg. from them raw materials for the chemical and microbiological industries, effects the hydrolysis in two steps. In the first, the hydrolysis is carried out in the upper zone of the reactor, in the vapour phase, in the presence of a 10 wt.% concn. of acid and water vapour, so that the pentosans are converted into furfural, acetic acid, methanol and acetone, whilst the hexosans are split into di- and trisaccharides. In the second step, hydrolysis takes place in the bottom of the reactor in the fluid phase. Diluted, i.e. less than 10 wt.% acid and water vapour are used in the reaction, so that the di- and trisaccharides of the first step are split into monosaccharides with the accompanying formation of sugars and fatty acids.

Method replaces the highly complicated batch-working previous methods requiring up to twenty reactors, by a continuous process using only one.

Sugar-beet pulp dewatering press - has truncated conical mesh drum inside which are conical pressing rollers, made of discs with annular gap of decreasing width

KIEV FOOD IND TECHN (SMEL=) 11.02.76-SU-326806

P71 (30.03.79) B30b-09/26

Press for dewatering sugar-beet pulp and other moisture-contg. prods, comprises a revolving mesh filtering drum, inside which are rotating pressing rollers, mounted on arms via hinge-links. Scraper blades are mounted on a single shaft down the centre of the drum and the blades are set at an angle. The possibility of controlling the process and increasing the degree of dewatering is realised by making the filter drum and the rollers as truncated cones, which widen out in the direction in which the beet pulp is moving. They are positioned relative to one another, leaving a gap which decreases in the same direction. The pressing rollers consists of a collection of freely-rotating discs, and the blades are installed with a means by which their angle of slope can be altered.

Appts. for processing bagasse - with centrifugal impaction in hot exhaust gas for defibering and drying bagasse
ENTOLETER INC 26.04.78-US-900150
J09 Q73 (29.11.79) F23g-07/02
D/S: N(BR, DT, GB, JA, SW)

A method of processing fibrous organic material comprises centrifugally impacting the material in an atmosphere which principally comprises gas exhausted from a combustion zone. The impacted material entrained in the gas is delivered to a separation zone where the material is separated from the gas. Preferably the separation zone is energized by the fluid energy of the gas. The separated material is preferably applied as a fuel for the combustion zone.

Electricity may be generated from heat produced in the combustion zone. This electricity may be used to preheat the material before being centrifugally impacted.

The apparatus is used to treat waste fibrous material such as bagasse.

The moisture content of the bagasses can be reduced from 52% to 40% or less. This enables combustion to be carried out at a higher temperature. When the input bagasse has 50% moisture, the net heat value produced using conventional apparatus is about 2,400 BTU/lb. The present system improves this to about 3,600 BTU/lb.

Cigarette producing machine - including a shift register through which control signals for various processing stages are transported
HAUNI-WERKE KORBER KG 08.01.69-DT-900701
P15 (29.11.79) *CA-956-011 +A24c-05/31

When a machine for the processing of rodlike articles of tobacco, and esp. one for the assembly of a cigarette and a filter together with an adhesive strip, is started up or stopped, successive timing impulses are generated synchronously with the forward movement of the components.

The frequency of the impulses is timed to the progress of the components in such a way that when a timing impulse is generated, the components reach a point along the processing path which had been reached by the preceding group of components when a previous timing impulse was put out. Timing impulses are selected which are put out simultaneously with the arrival of a definite component at a predetermined point along the path, and the timing impulses selected control the putting out of the signal for starting or stopping the working operations.

The technique overcomes the shortcomings of timing devices which produce scrap on starting up, and it operates independently of the speed of revolution of the machine, at accurately defined points in time corresp. to the motion of the components. 8.1.69 as 900701 Add in 2121044, 2161611 (18pp1045)

Viscose fibre reinforced plastics dentures - are mfd. by degassing doubling mass and plastics mash in vacuum filling and insulating cuvette and polymerising plastic
LORENZ S 05.07.78-DL-206513
A96 P32 (12.09.79) A61c-13

Dentures of fibre reinforced plastics material are mfd. in three successive stages in a doubling cuvette. In the first stage the doubling mass which is to be introduced into the cuvette composed of split halves is degassed in vacuum and the viscose fibre reinforced polymer and monomer containing mash is degassed in vacuum with simultaneous agitation until setting pt. is attained, the mash is then aerated and covered until ready for use.

In the second stage the split cuvette halves which are filled with the doubling mass are insulated by covering the teeth and the adjacent wax portions with "Stefanat Knetbar" (RTM), the doubling mass is coated with "Altisol" (RTM), and elastic foil sprayed with silicone oil is placed at the interface of the split cuvette halves. In the third stage, the closed cuvette is exposed briefly to the action of pressure, then opened for removal of the foil, finally the lower half of the cuvette supporting the model and the still soft denture body is polymerised in water at a temp. of from 26 to 28°C and pressure of six atmos.

Mfg. costs are lowered whilst accuracy and masticating load distribution are improved. 5. 7. 78 as 206513 (17pp536)

Cosmetic skin powder prepn. - from hydrochloric acid soln. of silk fibre

ICHIMARU BOEKI KK 19.04.78-JA-046036
A96 (26.10.79) A61k-07

The method comprises (a) adding 12 l aq. 1.2N HCl soln. to 2 kg of silk fibre (e.g. bleached rewinded silk thread dust, dil. alkali-treated rewinded silk thread dust, dilute alkali-treated spinned silk thread dust, etc.), (b) standing the mixt. in the water bath of 60-70°C for 24 hrs., (c) stirring the mixt. strongly for 30 mins., (d) filtering the mixt. through a Buchner funnel, (e) adding 20 pt. of water to 2 pt. of thus obtd. residue, (f) stirring the mixt. slowly, (g) removing floated dusts and foreign matters by decantation, (h) adding 5-6 times amt. on the ppt. of water to the clear liq., (i) standing the mixt. for ca. 12 hrs., (j) removing floated matters again through decantation, (k) sepg. water layer, (l) adding 5-6 times the amt. of water to the residue, (m) decanting the mixt. 2-3 times at pH 5.5-7.5 using aq. 2N NaOH soln., (n) filtering the mixt. under aspiration, (o) immersing the residue in ethanol for 2 hrs., (p) filtering it again under aspiration, (q) drying the residue and (r) pulverising the dry residue.

Excellent powder for cosmetic use can be prepd. inexpensively from waste silk material with high yield through the sample process. The obtd. powder has elegant glossiness, noble touch and pearl-like brightness specific to silk and can be used as a cosmetic base. It has excellent affinity for skin and humidity-retaining property. It is nontoxic and forms a thin protective film on skin and does not prevent the skin respiration and the secreting ability of skin. 19.4.78 as 046036 (5pp5)

Dental compsn such as a dental resin compsn. or composite resin compsn. contains organic peroxide such as ketone peroxide, tert. amine such as triethylamine and L-ascorbic acid.

The dental resin compsn. consists of monomer or prepolymer of methacrylate and/or acrylate. The dental composite resin compsn. consists of a polymer binder of acrylate and/or methacrylate and inorganic powder such as quartz powder, aluminium oxide powder and silica powder.

Compsn. has a long gel time but cures rapidly at prevailing in the mouth. 12.5.75 as 057057 C08f-20/10, 2/44, 4/40 (10.11.79) SANKIN KOGYO KK (5pp)(J51132687)

Resinous compsns. for repair or construction of dental crowns - comprising modified bismethacryloxy ethoxy phenyl propane and polymethyl methacrylate
G-C DENTAC IND 15.12.75-JA-148406
A96 E14 +P32 (A14 A25) (12.11.79) *DT2656-847 +C08f-02/44 C08f-20/30

A paste of resinous material for construction and repair of dental crowns comprises a liq. component (A) of formula (I)

and a powder component (B) which is a polymeric methacrylic acid deriv. In (A) the average number of ethyleneoxide units (m+n) is 2.2-6.0.

Component (A) is a modification of 2,2-bis(4-methacryloxyethoxyphenyl)-propane (I). (I) is regarded in dental technology as having excellent physical properties as a filling and crowning constituent and has been extensively used for this purpose. The disadvantage of (I) is that it must be liquefied before use by heating. A complicated apparatus and lengthy process are necessary when (I) is employed by the normal building-up technique. The cpd.(A) of the invention is already liq. and is therefore much easier to use. 15.12.75 as 148406 C08f-20/30 2/44 (12.11.79) G-C DENTAL IND (5pp)(J52072749)

A96 B04 F01 P32 (A11 B07) (27.11.79) A61c-19/06

Capillary hollow fibre comprises a flexible semipermeable polymeric material e.g. cellulose acetate of outside dia. $\leq 500 \mu$ and of wall thickness 1-100 μ . The lumen of the fibre contains a known amount of an indicator-diagnostic agent. The indicator is an acid-base, oxidn.-redn., tooth-corrosive action or proteinaceous proteolytic-action indicator. The indicator gives diagnostic information after chemical reaction with the prods. of localised diseases in the oral cavity. The indicator diffuses out of the fibre at a rate controlled by its permeability.

The fibre is suitable for diagnosis of dental diseases in the oral cavity. The fibre may contain therapeutic agents when treatment of dental diseases is required. 26.10.77 as 845587 (6pp1248)

Foam regulator for washing powders - comprises aluminosilicate and polysiloxane having temp. dependent foam suppressing effect

BERGK K H 29.06.78-DL-206367

A97 E33 (A26) (05.09.79) C11d-03/08

Foam regulator for washing powders to provide temp. dependent control of foam development is a conventionally prepd. mixt. of (a) 60-90 wt. % aluminosilicate $\text{Na}_z(\text{AlO}_2)_x(\text{SiO}_2)_y \cdot x\text{H}_2\text{O}$ (I) (Z and y = 2-15, x=15-35) of particle size $\geq 500 \mu\text{m}$, (b) 10-40 wt. % polysiloxane (II) of viscosity 1800-2200 cSt and (c) 0-30 wt. % anionic or nonionic surfactant.

(I) is pref. crystalline, esp. a type A, X or Y zeolitic molecular sieve, or it is or aluminosilicate gel. Esp. the particle size distribution is about 90 wt. % 3-10 μm , < 5 wt. % < 100 μm and the balance $\geq 500 \mu\text{m}$. The nonionic surfactant is esp. an ethylene oxidealkanol condensate and the regulator is pref. added to the washing powder after spraying-drying.

Used for automatic washing machines. The compsn. allows adequate foaming at low temp. but suppresses excessive foaming at higher temp. without adversely affecting washing efficiency. Exact metering of the compsn. into the washing powder is possible and, after release of (II), the (I) will bind alkaline earth and heavy metal ions thus improving washing effect. 29.6.78 as 206367 (9pp1251)

Compsn. for thermo-regulated perfume release in washing powder - comprises perfume on hydrated aluminosilicate

KAUFMANN D 19.07.78-DL-206798

E33 (12.09.79) C11d-03/08

Compsn. for use in powdered washing agents to provide thermoregulated release of perfume during washing comprises (a) an aluminosilicate of formula $\text{Na}_z(\text{AlO}_2)_x(\text{SiO}_2)_y \cdot x\text{H}_2\text{O}$ (where z and y = 2-15, x = 15-35) with particle size 500 μm and (b) a standard perfume at wt. ratio 2-20:1.

Pref. the aluminosilicate is crystalline, esp. it is a type A, X or Y zeolitic molecular sieve, or an aluminosilicate gel. Esp. it has particle distribution about 90 wt. % 3-10 μm , < 5 wt. % 100 μm and the rest $\geq 500 \mu\text{m}$. Pref. the compsn is mixed with the washing agent after spray drying.

Used esp. in automatic washing machines. The perfume is storage stable in this form, and is completely released as the temp. is increased. The compsns. have no adverse effect on washing quality and can be exactly metered into the washing powders. The aluminosilicate binds alkaline earth and heavy metal ions so improved washing efficiency. 19.7.78 as 206798 (7pp1251)

Disinfectant detergent compsn. contg. 2-mercapto benzothiazole - with rapid bactericidal and fungicidal activity

VEB CHEMIEKOMB BITT 17.07.78-DL-206754

E13 (D22) (26.09.79) C11d-03/34

Washing compsn. with disinfectant activity contains as active ingredient 2-mercaptobenzothiazole (I), opt. mixed with other active ingredients. When used alone (I) is pref. 0.05-1, esp. 0.3-0.7% of the compsn.

Other active ingredients are chlorinated condensed phenols, quat. ammonium, peroxy or trialkyltin cpds.

or HCHO adducts and total concn. of active ingredients is 0.2-1% at wt. ratio 0.5-2pts. (I) to 1 wt. pt. other active components.

Esp. used for chemical-thermal disinfection. (I) has low toxicity (oral LD_{50} in rats $> 4\text{g/kg}$), does not irritate the skin and has rapid bactericidal and fungicidal actions at relatively low concn. 17.1.78 as 206754 (11pp1251)

Surface-active alkyl sulphate cpds. prepn. - includes sulphonation of aliphatic alcohol(s) and alkali neutralisation in presence of higher fatty acids

CHEM IND RES INST 19.03.77-SU-483101

E17 (15.03.79) C07c-141/08 C11d-01/14

Surface-active alkylsulphates of improved quality are obtd. by sulphonation of aliphatic alcohols with subsequent alkali neutralisation in the presence of 17-20C aliphatic carboxylic acids used in quantity 20-25%.

Since the fatty acids evolve considerably less heat during neutralisation, they absorb part of the heat evolved by the sulphoesters leading to a decrease in decompn. and time of reaction.

Kotelnikov B. P., Kasavchenko A. I., Kotenok N. A. et al Bul.10/15.3.79 19.3.77 as 483101 (2pp1347)

ZN/ ★ D25 88975B/49 ★ SU-653-294
 anionic surfactant powder prepn. - by atomising oxyethylated
 surfactant on to carbamide, while mixing and dispersing
 REZNIKOV I G 24.02.76-SU-328579
 E16 (25.03.79) C11d-11/02

Non-ionic surfactant powder is obtd. by mixing oxyethyl-
 ated surfactant with crushed carbamide. To speed up and
 simplify the process, the oxyethylated surfactant is spray-
 ed on to the carbamide, with simultaneous mixing and dis-
 persion of the mixt. The oxyethylated surfactant and car-
 bamide are in ratio (by wt.) of 1:1 to 1:6.

This speeds up the process of prod. formation by red-
 ucing the reaction time between the carbamide and surfac-
 tant since the molecular interaction between the evenly-
 distributed interacting components, i.e. finely crushed
 carbamide and modified surfactant in a dispersed-drop
 state, takes place much more rapidly. This is also help-
 ed by the intensive mixing and simultaneous dispersion
 of the resulting prod. The technique of obtg. friable sur-
 factant is simplified, and working conditions are improv-
 ed, since no solvents are used, yet the prod. obtd. is
 of high quality.

 Granular detergent compsns. - contg. enzyme dispersed in separate
 water-soluble resin film

PROCTER & GAMBLE CO 20.04.77-US-789323
 A97 E19 (A18 A25 D16 E34) (27.11.79) C11d-17/06

Granular detergent compsn. comprises (a) 1-40% ≥ 1 H₂O-
 soluble anionic, nonionic, ampholytic or zwitterionic sur-
 face active agents (I); (b) 10-60% of a detergent builder
 (II); and (c) a non-dusting article (one dimension ≤ 20 mm.;
 thickness ≥ 50 mils.) consisting of an enzyme (III) dispers-
 ed in an H₂O-soluble resin (IV) film.

(II) is an Na or K polyphosphate, (bi)carbonate, silicate,
 polyacetate, (poly)carboxylate, or polyhydroxysulphonate.
 (III) is a proteolytic and/or amylolytic enzyme. (IV) is
 PVA, cellulose ether, polyethylene oxide, starch, PVP,
 polyacrylamide, polyvinyl methyl ethermaleic anhydride,

polymaleic anhydride and/or polystyrenemaleic anhydride.

The non-dusting (III)-contg. article is non-crushable,
 provides controlled release of (III) into wash water solns.,
 is leak-proof, and gives improved stability to (III). In addn.
 use of the article simplifies packaging equipment for deter-
 gent compsns., and allows unused (III)-contg. articles to
 be conveniently and efficiently recycled. 20.4.77 as

 Detergent compsns. for effective oily soil removal - contg. oily soil
 dissolving agent and solvent stripping agent

PROCTER & GAMBLE CO 03.10.77-US-839221
 A97 E19 (A25) (27.11.79) C11d-07/24

Cleaning prod. compsn. for removing oily soil from fab-
 rics in an aq. washing medium consists of: (1) a discrete
 oily soil dissolving agent comprising (a) 20-97% by wt.
 of an H₂O-insol. solvent (I), (b) 3-30% by wt. of an H₂O-
 in-oil emulsifier (II) soluble in (I), (c) 0-77% H₂O, and (d)
 0-77% detergency builders (III); and (2) a discrete unit(s)
 consisting of 10-80% by wt. of total prod. of a solvent
 stripping agent comprising 5-100% of an H₂O-soluble sur-
 factant (IV), 0-95% H₂O, and 0-95% detergency builder (V).

(I) may be a 10-18C alkane or alkene (flash pt. $\leq 65^\circ$
 (Tag closed cup); initial b.pt. $\leq 130^\circ$; solidification pt.
 $\geq 20^\circ$), or an ester R₁CO₂R₂ (R₁ = 7-17C alkyl; R₂ = 1-10C
 alkyl; total R₁+R₂ = 8-23C). (II) has HLB value 2-12, and
 consists of 25-100% of emulsifier cpds. with $\leq$ two 9-20C
 alkyl gps. each from (i) dialkyl sulphosuccinic acid (and
 NH₄, alkali(ne earth) metal, mono-, di-, and tri-(1-4C)
 alkyl and alkanolammonium salts); (ii) imidazolium quat.
 NH₄ cpds.; (iii) MOP(O)(O(C₂H₄)_mR₂)(O(C₂H₄)_nR₁) (R₁R₂ =
 alkyl; nm = 0-8; M = H or salt forming cation) (where un-
 less stated alkyl = 0-20C).

(III) and (V) are H₂O-soluble ortho- or poly-phosphates,
 phosphonates, (bi)carbonates, polyhydroxysulphonates, sil-
 icates, (poly)carboxylates, and H₂O-insol. aluminosili-
 cates, and mixts. (IV) may be any conventional anionic,
 nonionic, zwitterionic, amphoteric, or cationic surfactant,
 or mixts. 3.10.77 as 839221 (12pp478)
